## OMRON USER'S MANUAL

# Programmable Controller

Model SYSMAC-**S6** 

#### INTRODUCTION

"OMRON SYSMAC" is the trade name of OMRON's programmable controllers unparalleled in reliability and versatility. Programmable controllers, which were initially developed to meet the demands by equipment manufacturing industries and large-scale plants for their production facilities, now answer the needs of industries from every field and have become original equipment for installation at factories. The above trend has induced original equipment manufacturers to design the incorporation of programmable controllers in their machinery and equipment, and thus the demand for availability of the programmable controllers that can be handled as easily as components has been increasing. Accordingly, OMRON has sought to develop programmable controllers which are: a. small and economical, b. easy to handle by merely connecting a load and power, and c. easy to operate by anyone at site, in addition to possessing flexibility that permits adapting to changes to the controlled systems or control parameters with simple keyboard operation and high reliability which can be materialized only by electronic control.

OMRON now offers with confidence the OMRON SYSMAC-S6 Module Type Programmable Controller, a first-class programmable controller with "CPU function" and "techniques responding adequately to the needs at every site." Programming with the SYSMAC-S6 can be performed easily and directly from ladder diagrams using the programming console connected to the CPU.

Since the programmable controller adopts the building block system, the I/O units to which controlled devices are connected, can be expanded to a maximum of 64 points in increments of 4 I/O points per unit.

OMRON SYSMAC-S6 CODING SHEET

#### 1. Features

Highly sophisticated programmable controller in a DIN-96 sized housing.

- Conversational programming system employed
   The operability of programming and debugging is greatly improved through communications between the CPU and the operator in the dialogue mode via messages on the LCD of the programming console.
- Programming console removable from the CPU while SYSMAC-S6 is in operation
   In addition, cassette interface and monitor functions are provided as standard equipment.
- Abundant functions for improved maintenability and operability
   The high-speed counter (1kHz max.) and reversible counter instructions are provided for position control or sequential operation control. Furthermore, maintenability and operability are improved by multi-point monitoring, graphic monitoring, diagnostic functions,
- Either ROM or RAM selectable for memory
   For the ROM memory, two kinds of user programs can
   be selected by an external signal. The RAM memory is
   backed up by the built-in capacitor in the CPU and the
   battery unit, thus protecting the memory from data loss.

etc., which offer a wide range of applications.

- Flexible mounting style through motherboardless design
  The SYSMAC-S6 can be mounted as an integrated unit,
  or as a separate unit either on a DIN rail or on a mounting panel, or can be installed within a control panel
  because of its unique design that does away with a
  motherboard.
- Expandable I/O capacity (4 points per unit)
   In addition to the standard 12 input points and 8 output points incorporated in the CPU, a maximum of 44 I/O points can be optionally added in units of 4 points for I/O expansion.

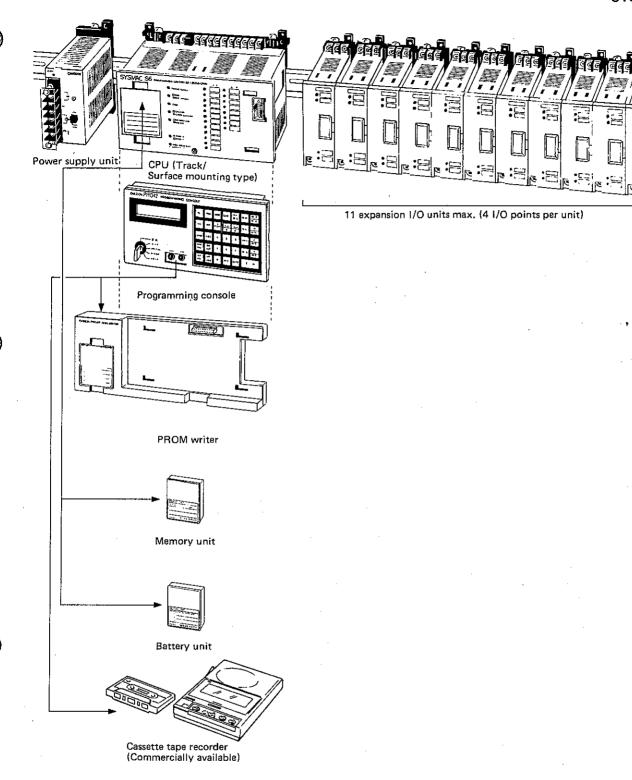

## 2. System Configuration and Specifications

#### 2.1 Available Types

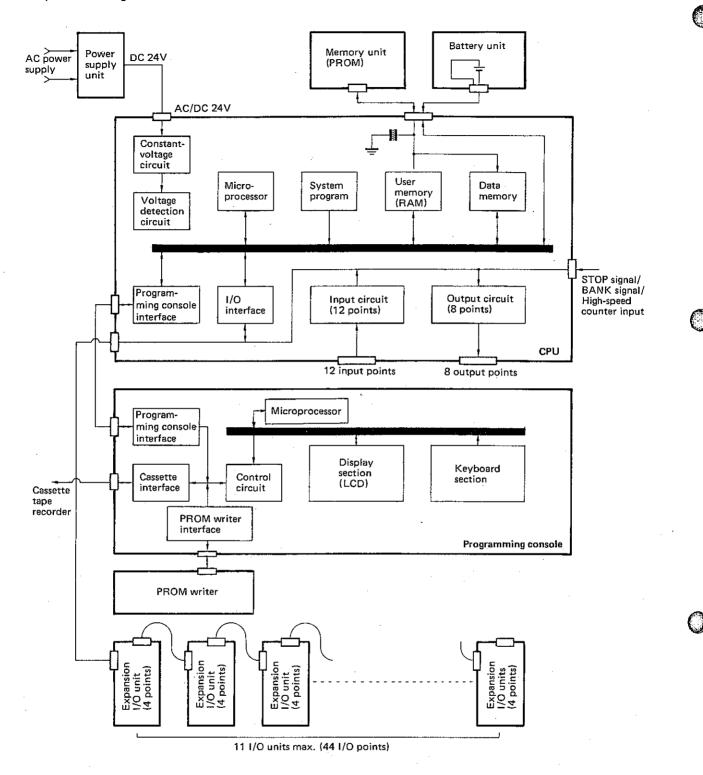

The SYSMAC-S6 consists of a CPU (Central Processing Unit) and input/output units. A programming console, a PROM writer and a power supply unit are available as peripheral equipment.

NOTE: \* There are two methods available for protection of the programs stored in the RAM as well as the status data of the respective latching relays, counters, high-speed counter and reversible counter. One is by the charge voltage of the capacitor and the other, by the battery backup.

a. With the super capacitor built in the CPU, memory

retention is guaranteed for one week when the capacitor is fully charged.

With the battery backup method, the lithium battery in the battery unit backs up the memory for retention. The service life of the built-in battery is about 2 years at a temperature of 25°C. If the ambient temperature at which the lithium battery is to be used exceeds 25°C, the battery life will be shortened.

#### SYSMAC S6

#### **■ DIAGNOSTIC FUNCTIONS**

As the diagnostic functions of the SYSMAC-S6, checks on the items listed in the following tables are performed in the PROGRAM, RUN and MONITOR modes, respectively.

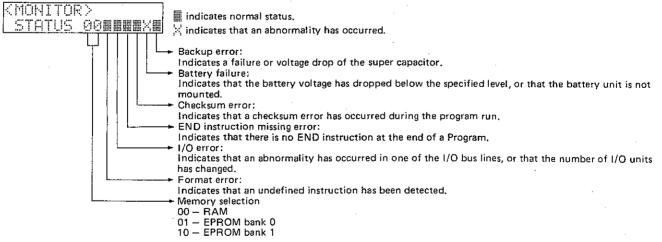

#### PROGRAM mode

| 7 Diagnost       | ic function;                 |   | Error message                         |
|------------------|------------------------------|---|---------------------------------------|
| Title Title      |                              | Function-   | on program<br>ming console<br>display |
|                  | Syntax<br>error check        | Checks the program for proper syntax.                                   | SYNTAX ER.                            |
|                  | END<br>instruction<br>check  | Checks the presence of END instruction at the end of the program.       | END MISS                              |
| Program<br>check | Coil<br>duplication<br>check | Checks coil number for duplication.                                     | COIL<br>DOUBLE                        |
|                  | Circuit<br>error check       | Checks the circuit for configuration.                                   | CIRCUIT ER.                           |

## 3. Assignment of Relay Numbers

Relay numbers correspond to the data memory areas and the operating state (ON/OFF) of each relay is stored in the corresponding memory area.

The method of assigning relay numbers used for the SYSMAC-S6 is as follows.

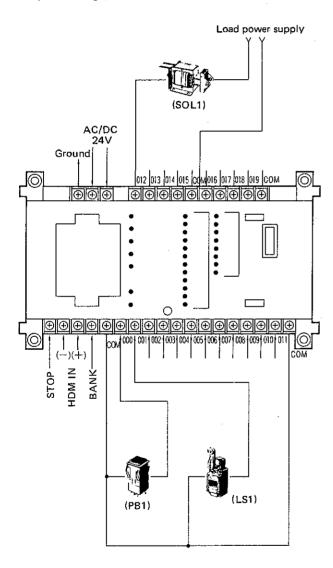

#### 3.1 List of relay numbers

| Name   | No. of points  | Symbol  |   | i e lees<br>Haanae | frasilis<br>Maria                          |             | Relay n    | umber       |           |             |     |           |
|--|----------------|---|---|--------------------|--|-------------|------------|-------------|-----------|-------------|-----|-----------|
| Input relay  | <b>提到到</b> 000 | 35/18/4/2019  | 000   | 001                | 002  | 003         | 004        | 005         | 006       | 007         | 800 | 009       |

#### 3.2 Determination of I/O Relay Numbers

- 1. In a sequence circuit diagram which is generally known, a sequence circuit is drawn with input/output devices included and I/O device symbols and relay numbers are arbitrarily determined. However, since the SYSMAC cannot recognize such arbitrary I/O device symbols and relay numbers, it is necessary to determine the I/O terminals to which I/O devices are to be connected.
- 2. The ladder diagram of the SYSMAC-S6 requires the relay numbers corresponding to the I/O devices. The relay numbers are determined by the locations (I/O terminals) of I/O terminal blocks, to which the I/O devices are connected. Each of these relay numbers must be used for ladder diagrams and programming.

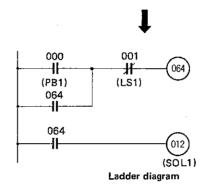

#### Example of Wiring I/O Device

#### Circuit Example

General sequence circuit

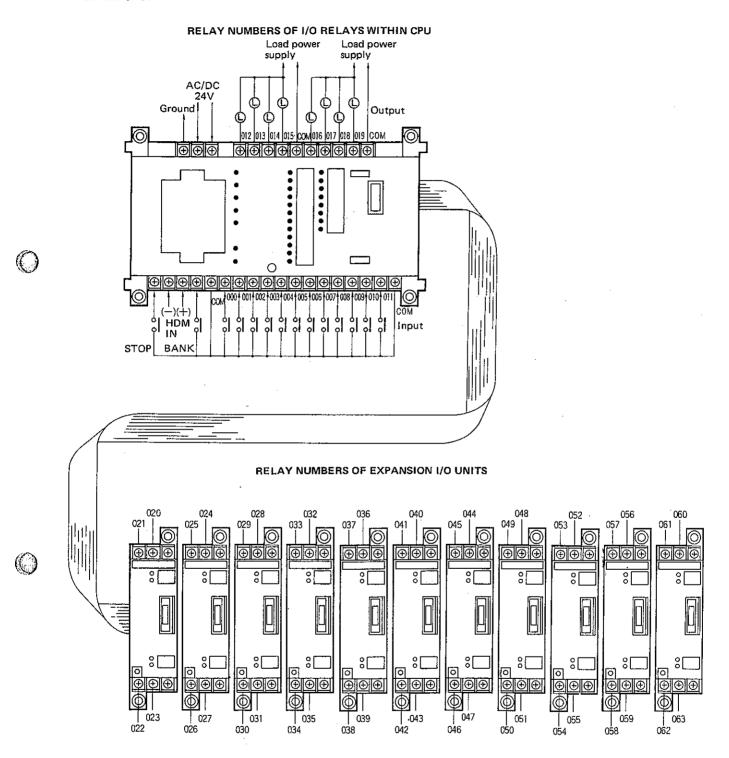

PB1 and LS1 are connected to the input unit while SOL1 is connected to the output unit. R1 employs an internal auxiliary relay (064). In this case, SOL1 may be connected directly to the output unit wihtout using the internal auxiliary relay.

#### NOTES:

- The realy numbers to which no expansion I/O unit is inserted,
- can be used as auxiliary relay numbers.
  The relay numbers to which an expansion input unit is inserted, cannot be used as auxiliary relay numbers.
- The relay numbers to which an expansion output unit is inserted but no output device is connected, can be used as internal auxiliary relay numbers. (However, the output relay will turn ON/ OFF.)
- The relay numbers at which no output device is connected to any output terminal in the CPU, can be used as internal auxiliary relay numbers. (However, the output relay will turn ON/

 The relay numbers of the I/O relays within the CPU are fixed. In case of expansion I/O units, relay numbers are automatically assigned to the relays in each I/O unit according to the sequence of connection of the unit from the CPU.

NOTE: The mounting locations of expansion I/O units are free.

The CPU judges whether the unit located is an input unit or an output unit,

#### SVSMACJS

## 3.3 Determination of Internal Auxiliary Relay Numbers

The SYSMAC-S6 has 40 internal auxiliary relays which are used for internal data transfer in sequence circuits. They are independent of I/O devices in sequence. Since the internal auxiliary relays are the data memories incorporated in the CPU, no I/O unit is required to be mounted.

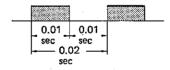

- Relay numbers 064 to 103 may not necessarily be assigned consecutively.
- Relay coil numbers cannot be used in duplication within the same program.
- If more than 40 internal auxiliary relays are required, expansion I/O relay numbers to which no expansion I/O unit is connected may be used. When an expansion output unit to which no output device is connected is mounted, its output relay numbers may also be used as internal auxiliary relays.

## 3.4 Determination of Special Auxiliary Relay Numbers

8 special auxiliary relays are provided. These relays are sort of internal auxiliary relays which operate and release according to the internal conditions controlled by hardware and are independent of the I/O devices in sequence. Relay No. 104:

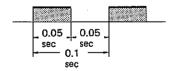

When relay No. 104 is turned ON by a program, the final output is inhibited. In this case, however, the program execution (in the RUN or MON!TOR mode) continues. Relay No. 105:

This relay is used to generate 0.02sec clock. When used in junction with a counter, it functions as a timer for memory retention during a power failure and as a short-time timer.

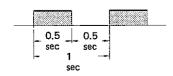

#### Relay No. 106:

This relay is used to generate 0.1sec clock. When used in combination with a counter, it functions as a timer for memory retention during a power failure.

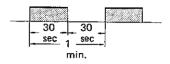

#### Relay No. 107:

This relay is used to generate 1sec clock. When used in combination with a counter, it functions as a timer for memory retention during a power failure and as a long-time timer. The relay output can also be used as a flicker signal.

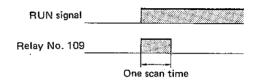

#### Relay 108:

This relay is used to generate 1min clock. When used in combination with a counter, it functions as a timer for memory retention during a power failure and as a long-time timer.

#### Relay No. 109:

When the SYSMAC-S6 starts operating, this relay operates only for one scan time. Use this relay as an initial reset signal for counter, high-speed counter, reversible counter or latching relay.

#### Relay No. 110:

This relay operates when a battery failure occurs and releases when the battery is returned to normal. If the Battery Failure signal is desired to be transmitted externally, prepare and program a circuit using the contacts of this relay.

#### Relay No. 111:

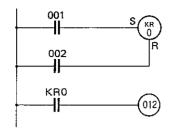

This relay operates when a checksum error occurs. When the relay operates, the "CHECKSUM ERR" indicator on the front panel of the CPU flashes. If the Checksum Error signal is desired to be transmitted externally, prepare and program a circuit using the contacts of this relay.

#### 3.5 Determination of Latching Relay Numbers

The SYSMAC-S6 has 8 latching relays whose operating states before a power failure can be retained in the data memory. Since the operating states of these relays are stored in the memory, all their outputs at the time of the power failure are turned off, but the relays will return to the state before the power failure when power is applied again.

- Relay numbers 0 to 7 may not necessarily be assigned consecutively.
- When using a latching relay, the letters "KR" must be prefixed to the relay number (e.g., KR5).
- Relay coil numbers cannot be used in duplication. However, the number of relay contacts is not limited.
- When set and reset input signals are applied simultaneously, the reset input signal takes precedence over the set input signal.
- These relay outputs cannot be transmitted directly to an output terminal. If any of the relay outputs is desired to be transmitted externally, prepare and program a circuit so that the relay output may be transmitted externally through an output relay.

#### 3.6 Determination of Timer Numbers

The SYSMAC-S6 has 8 timers, which are used for timer numbers in programming.

- Timer numbers 0 to 7 may not necessarily be assigned consecutively.
- Timer coil numbers cannot be used in duplication. However, the number of timer contacts is not limited.
- When using a timer, the letters "TIM" must be prefixed to the relay number (e.g., TIM3).

#### 3.7 Determination of Counter Numbers

The SYSMAC-S6 has 8 counters, which are used for counter numbers in programming.

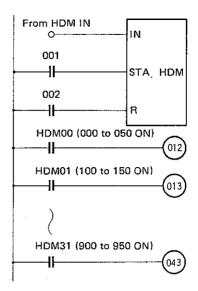

- Counter numbers 0 to 7 may not necessarily be assigned consecutively.
- Counter coil numbers cannot be used in duplication.
   However, the number of counter contacts is not limited.
- When using a counter, the letters "CNT" must be prefixed to the relay number (e.g., CNT4).

## 3.8 Determination of High-speed Counter Output Numbers

The SYSMAC-S6 has one high-speed counter and 32 outputs which are used in programming for multiple preset value setting.

The high-speed counter does not require its coil number and cannot be used in duplication.

- High-speed counter output numbers 00 to 31 may not neccessarily be assigned consecutively. When using a highspeed counter output, the letters "HDM" must be prefixed to the output number (e.g., HDM31).
- The number of contacts for high-speed counter outputs is not limited. These outputs cannot be transmitted directly by to an output terminal. If any of the relay outputs is desired to be transmitted externally, prepare and program a circuit so that the relay output is transmitted externally through an output relay.
- When set and reset input signals are applied simultaneously, the reset input signal takes precedence over the set input signal.
- For count input of the high-speed counter, connect the external input directly to the HDM IN terminal.

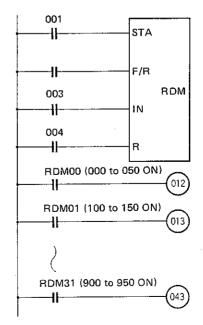

## 3.9 Determination of Reversible Counter Output Numbers

The SYSMAC-S6 has one reversible counter and 32 outputs which are used in programming for multiple preset value setting.

The reversible counter does not require its coil number and cannot be used in duplication.

- Reversible counter output numbers 00 to 31 may not necessarily be assigned consecutively. When using a reversible counter output, the letters "RDM" must be prefixed to the output number (e.g., RDM31).
- The number of contacts for reversible counter output is not limited. These outputs cannot be transmitted directly to an output terminal. If any of the relay outputs is desired to be transmitted externally, prepare and program a circuit so that the relay output is transmitted externally through an output relay.
- When set and reset input signals are applied simultaneously, the reset input signal takes precedence over the set input signal.

#### 4.2 Explanation of Instruction Words

■ LOAD (LD) & OUTPUT (OUT) INSTRUCTIONS If each logic line starts with an NO contact, use the LD instruction. Use the OUT instruction for relay coil.

| Coding  |      |      |  |  |
|---------|------|------|--|--|
| Address | OP   | Data |  |  |
| 200     | · LD | 000  |  |  |
| 201     | OUT  | 050  |  |  |

| Contents    | of Registers |
|-------------|--------------|
| / R         | S            |
| 000<br>—II— |              |
| 000         |              |

#### Operation of each register

The LD instruction causes the content (ON or OFF state) of the specified relay number to be stored into the RESULT REGISTER (hereafter referred to as "R register"). It also causes the previous result in the R register to be transferred to the STACK REGISTER (hereafter referred to as "S register"),

The OUT instruction causes the content of the R register to be output to the specified relay number. In this case, the content of the R register will remain unchanged.

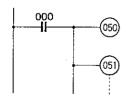

Bus bar of a different phase is not required to be programmed,

Connection to the bus bar of different phase (part is accomplished automatically by programming an OUT instruction.

#### Consecutive OUT instructions

If the OUT instruction is followed by another OUT instruction, this condition is regarded as a circuit error during the program check. However, each output relay operates normally.

| OP  | Data |
|-----|------|
| LD  | 000  |
| OUT | 050  |
| OUT | 051  |
| ;   | :    |

#### ■ LOAD NOT (LD-NOT) INSTRUCTION

If each logic line starts with an NC contact, use the LD·NOT instruction in place of the LD instruction.

Coding

| Address | . ∴.OP | <sup>∉</sup> Data// |
|---------|--------|---------------------|
| 200     | LD-NOT | 000                 |
| 201     | OUT    | 050                 |

#### Contents of Registers

| ∦ P               | ≓'S ∵ |
|-------------------|-------|
| - <del>- 11</del> |       |
| 000<br>**         |       |

#### Operation of each register

The LD·NOT instruction causes the content of the specified relay number to be inverted and then stored into the R register.

Like the LD instruction, this instruction causes the previous result in the R register to be transferred to the S register.

#### **■** AND INSTRUCTION

NO contacts in series are processed by the AND instruction.

| Coding    |      |      |  |  |
|-----------|------|------|--|--|
| Address / | OP - | Data |  |  |
| 200       | ĻD   | 000  |  |  |
| 201       | AND  | 001  |  |  |
| 202       | OUT  | 050  |  |  |

Contents of Registers

|                    | ∜S S |
|--------------------|------|
| 000<br>—           |      |
| 000 001<br><b></b> |      |
| 000 001            |      |

#### Operation of each register

The AND instruction causes the logical AND operation to be performed between the content of the specified relay number and the content of the R register. The result of the logical AND operation will be newly stored in the R register.

#### Number of contacts

The number of contacts is not limited for use on a logic line. As many NO contacts as required can be connected by means of the  $\begin{bmatrix} AND \\ -I - \end{bmatrix}$  key.

| ÷.≓. OP.∄ | )Data |
|-----------|-------|
| LD        | 000   |
| AND       | 001   |
| ÄND       | 002   |
| . :       | :     |

In this case, the contact of the first relay number 000 is at the start of each logic line.

Therefore, the relay contact must be programmed as "LD000".

#### **■** AND NOT INSTRUCTION

If an NC contact is connected in series, use the AND·NOT instruction in place of the AND instruction.

Coding

| - Address | OP      | Data |
|-----------|---------|------|
| 200       | LD      | 000  |
| 201       | AND-NOT | 001  |
| 202       | OUT     | 050  |

Contents of Registers

| · R           | , s |
|---------------|-----|
| <b>─11</b> —  |     |
| 000 001<br>-{ |     |
| 000 001<br>   |     |

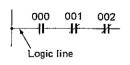

#### Operation of each register

The AND-NOT instruction causes the content of the specified relay number to be inverted and then ANDed with the content of the R register. The result of the logical AND operation will be newly stored in the R register.

#### Number of contacts

The number of contacts is not limited for use on a logic line. As many NC contacts as required can be connected in series by means of AND NOT keys.

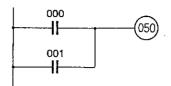

| A STOP  | Data |
|---------|------|
| LD      | 000  |
| AND-NOT | 001  |
| AND-NOT | 002  |
| i       | ;    |

In this case, the contact of the first relay number 000 is at the start of each logic line. Therefore, the relay contact must be programmed as "LD000".

#### **■** OR INSTRUCTION

NO contacts in parallel are processed by the OR instruction.

Coding

| Coding  |      |        |
|---------|------|--------|
| Address | OP . | . Data |
| 200     | LD   | 000    |
| 201     | OR   | 001    |
| 202     | OUT  | 050    |

Contents of Registers

| . R f € | * S |
|---------|-----|
|         |     |
| 000     |     |
| 000     |     |

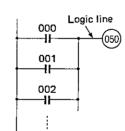

#### Operation of each register

The OR instruction causes the logical OR operation to be performed between the content of the specified relay number and the content of the R register. The result of the logical OR operation will be newly stored in the R register.

#### Number of contacts

The number of contacts is not limited for use on a logic line. As many NO contacts as required can be connected by means of the [OR] key.

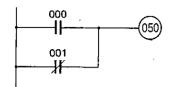

| ÓP  | Data |
|-----|------|
| LD  | 000  |
| OR  | 001  |
| OR  | 002  |
| i i | :    |
| OUT | 050  |

In this case, the contact of the first relay number 000 is at the start of each logic line. Therefore, the relay contact must be programmed as "LD000".

#### **■ OR NOT INSTRUCTION**

If an NC contact is to be connected in parallel, use the OR-NOT instruction in place of the OR instruction.

| Co | h | in | a |

| U00<br>001 |             |
| 8 2 8      |             |

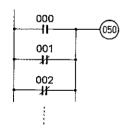

#### Operation of each register

The OR NOT instruction causes the content of the specified relay number to be inverted and then ORed with the content of the R register. The result of the logical OR operation will be newly stored in the R register.

#### Number of contacts

The number of contacts is not limited for use on a logic line. As many NC contacts as required can be connected by means of OR NOT keys.

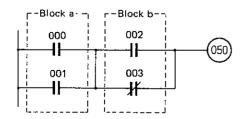

| e o op | Data/ |
|--------|-------|
| LD ·   | 000   |
| OR-NOT | 001   |
| OR-NOT | 002   |
| ÷      | :     |
| OUT    | 050   |

In this case, the contact of the first relay number 000 is at the start of each logic line.

Therefore, the relay contact must be programmed as "LD000".

#### ■ AND-LOAD (AND-LD) INSTRUCTION

For inter-block AND operation between two or more blocks, use the AND-LD instruction.

#### Coding

| Address | OP           | . Data |
|---------|--------------|--------|
| 200     | LD           | 000    |

NOTES:

- \* Use this instruction as the first instruction for the next block to be ANDed with the preceding block.
- \*\* Use the AND-LD instruction for series connection of two blocks (blocks a and b).

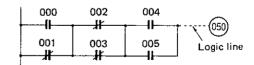

#### Operation of each register

- By the LD000 and OR001 instructions, the result of the logical OR operation in block a is stored into the R register.
- By the LD002 instruction in block b, the result of the operation in block a is transferred into the S register, while the result of the logical operation by instructions LD002 and OR NOT003 in block b is stored into the R register.
- 3. AND·LD instruction causes the logical AND operation to be performed between the R register (block b) and the S register (block a). The result of the logical AND operation will be newly stored into the R register.

#### Number of blocks

The number of blocks is not limited for AND-LD operation of a logic line. As many blocks as required can be continued for series connection by means of LD ~ AND LD LD keys.

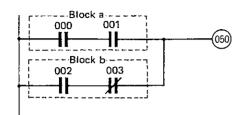

| //∳ OP\- b≥ | Data |
|-------------|------|
| LD          | 000  |
| OR-NOT      | 001  |
| LD-NOT      | 002  |
| OR-NOT      | 003  |

#### NOTES:

- Use this LD instruction as the first instruction of the next block to be ORed with the preceding block.
- \*\* Use the OR-LD instruction for parallel connection of two blocks (blocks a and b).

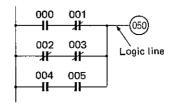

#### Operation of each register

- By the LD000 and AND001 instructions, the result of the logical AND operation in block a is stored into the R register.
- 2. By the LD002 instruction in block b, the result of the operation in block a is transferred into the S register, while the result of the logical operation by instructions LD002 and AND NOT003 in block b is stored into the R register.
- 3. The OR-LD instruction causes the logical OR operation to be performed between the R register (block b) and the S register (block a). The result of the logical OR operation will be newly stored into the R register.

#### Number of blocks

The number of blocks is not limited for OR·LD operation on a logic line. As many blocks as required can be continued for parallel connection by means of  $\stackrel{\text{LD}}{\text{H+}}$   $\sim$   $\stackrel{\text{OR}}{\text{H+}}$  keys.

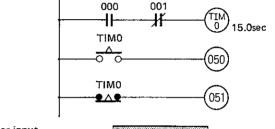

| OP -    | Data, |
|---------|-------|
| LD      | 000   |
| AND NOT | 001   |
| LD-NOT  | 002   |
| AND-NOT | 003   |
| OR-LD   |       |

| AND     | 005   |
| OR-LD   |       |
| i i     | ÷     |
| OUT     | 050   |
|         |       |

The OR-LD instruction is used when each block normally consists of a combination of two or more contacts.

#### **■** TIMER (TIM) INSTRUCTION

The TIM instruction can be used as an ON-delay timer in the same manner as a relay circuit.

Time-up output OUT050

Time-up output OUT051

#### Coding

| Coding   |                |       |
|----------|----------------|-------|
| .Address | OP             | Data  |
| 200      | ĹD             | 000   |
| 201      | AND-NOT        | 001   |
| 202      | TIM 0*         | 150** |
| 203      | LD-TIM         | 0     |
| 204      | OUT            | 050   |
| 205      | LD-NOT-<br>TIM | 0     |
| 206      | OUT            | 051   |

#### NOTES:

- \*Timer number 0 to 7.
   \*\*Time setting value 000 to 999 x 0.1sec. In this example, 150 denotes 15.0sec.
- 3. The program at the part of the timer coil

  (TIM) requires one address.

#### · Operation of each register

The timer starts when the content of the R register is logical 1 and resets when the content of the R register is logical 0.

#### Number of contacts

A time-up contact designates the timer number itself. Both NO and NC contacts can be used in the required quantity.

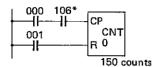

#### • Timer is of decrementing type

The timer is of a decrementing type which produces an output when the present value (time remaining) becomes "000". When the timer input is turned off, the present value of the timer returns to the preset value. The timer output is transmitted externally through an output relay as shown in the above circuit example.

Timer is reset at the time of a power failure
 If a power failure occurs, the timer is reset and the
 present value returns to the preset value. Therefore, if it
 is required to retain the present value of the timer in the
 memory, a memory retentive type timer circuit as shown
 below must be used for programming.

#### Memory retentive type timer

A circuit to memorize the present value of the timer during a power failure is configured using a combination of clock instruction and counter (CNT) instruction.

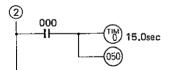

| is is OP | -Data |
|----------|-------|
| LD       | 000   |
| AND      | 106   |
| LD       | 001   |
| CNT 0    | 150   |
|          |       |

NOTE:

Consecutive OUT instruction and TIM instruction
 The operations of the circuits 1 and 2 below are the same, either of which may be used for programming.

| Fig. Of | 11/1/3 | Data |
|---------|--------|------|
| LD      |        | 000  |
| OUT     |        | 050  |
| TIM     | 0      | 150  |
|         |        | 1    |

When the NO contact 000 turns ON, output relay 050 is energized and at the same time, timer 0 starts operating.

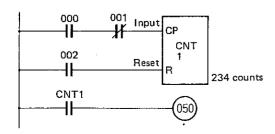

| OF  | <b>1</b> | · Data |
|-----|----------|--------|
| LD  |          | 000    |
| TIM | 0        | 150    |
| OUT |          | 050    |

When the NO contact 000 turns ON, timer 0 starts operating and at the same time, output relay 050 is energized.

 The set value of the timer can be changed while the SYSMAC-S6 is in operation when the RAM is used as a user memory.

#### **■** COUNTER (CNT) INSTRUCTION

The CNT instruction can be used as a preset counter in the same manner as a relay circuit.

| Count input          | 1 | 2 | 3 | 233         | 234 | 235 |
|----------------------|---|---|---|-------------|-----|-----|
| Count-up<br>(OUT050) |   |   |   | <del></del> |     |     |
| Reset input          |   |   |   |             |     |     |

#### Coding

| Address | OP      | Data  |  |
|---------|---------|-------|--|
| 200     | LD      | 000   |  |
| 201     | AND-NOT | 001   |  |
| 202     | LD      | 002   |  |
| 203     | CNT 1*  | 234** |  |
| 205     | LD-CNT  | 1     |  |
| 206     | OUT     | 050   |  |

#### NOTES:

- A counter program must be entered in the order of a count input circuit, a reset input circuit and a counter coil.
- Counter number 0 to 7.
   \*\* Counter setting value 000 to 999.

#### Operation of each register

The counter resets when the content of the R register is logical 1 and is enabled to count when the content of the R register is logical 0. A count input is provided from the S register.

#### Number of contacts

A count-up contact designates the counter number itself. Both NO and NC contacts can be used in the required quantity.

#### • Counter is of decrementing type

The counter is of a decrementing type which produces an output when the present value becomes "000" to indicate that the preset value is up. The present value of the counter returns to the preset value when a reset input is applied. The counter output is transmitted externally through an output relay as shown in the circuit example.

- After the preset value is up, subsequent count inputs are ignored.
- At the leading edge (i.e., from OFF to ON) of a count input signal, the counter decrements the present value by 1.

- When both a count input and a reset input are applied simultaneously, the reset input takes precedence over the count input. Even if the reset input is removed after this, the counter performs no counting operation.
- The present value of the counter is retained in memory during a power failure.

If a power failure occurs, the counter is not reset and the present value (i.e., count remaining) of the counter is retained in the memory. A memory retentive type timer can be programmed using a combination of clock instruction and a counter (CNT) instruction. For details, refer to TIMER (TIM) INSTRUCTION.

 The preset value of the counter can be changed while the SYSMAC-S6 is in operation when the RAM is used as a user memory.

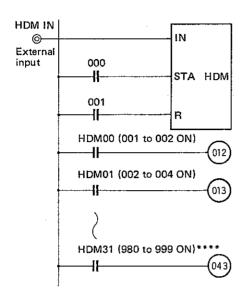

<sup>\*</sup> Special auxiliary relay 106 is for 0.1sec clock. (Special auxiliary relay 107 is for 1sec clock.)

#### OMRON

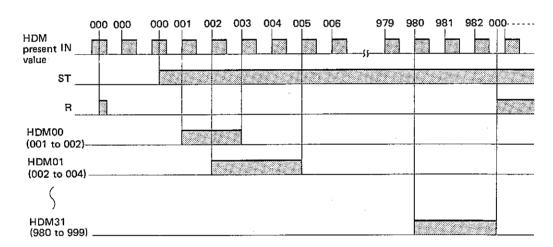

#### SYSMAC-S6

#### ■ HIGH-SPEED COUNTER (HDM) INSTRUCTION

The HDM instruction can be used as a high-speed counter by software. A count input signal must be directly connected to the HDM IN terminal of the CPU. The counter can respond to input signals at up to 1kHz.

| Coding  |        |        | _   |
|---------|--------|--------|-----|
| Address | Se OP  | . Data |     |
| 200     | LD     | 000    | h   |
| 201     | LD     | 001    | } . |
| 202     | HDM    | _**    | )   |
| 203     | LD-HDM | 00     | **  |
| 204     | OUT    | 012    | Ì   |
| 205     | LD-HDM | 01     | 1   |
| 206     | OUT    | 013    | 1   |
|         |        |        |     |
| 265     | LD-HDM | 31     |     |
| 266     | OUT    | 043    | İ   |

#### NOTES:

- \*A high-speed counter program must be entered in the order of a start signal (STA) and a reset signal (R).
- \*\* The high-speed counter does not require its coil number and cannot be used in duplication.
- \*\*\* The high-speed counter has 32 outputs (HDM00 to HDM31) for multiple preset value setting. These outputs are programmed similarly to the timer and counter contacts.
- \*\*\*\* The high-speed counter output (HDM31) continues to be in the ON state when the present count value is between 980 to 999. For programming preset values, refer to Section 6.7, Value Setting Operation.

SVSMAC-S6

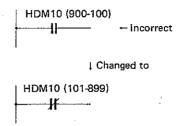

- When the start signal is logical 1, the high-speed counter (HDM) is in the operable state. When the start signal is logical 0, the counter is in the halt state.
- At the leading edge (i.e., from OFF to ON) of a count input signal, the high-speed counter increments the present value by 1.
- The high-speed counter has 32 outputs for multiple preset value setting (HDM00 to HDM31). For these relays, both NO (→I→) and NC (→I←) contacts can be used in the required quantity.
- For each high-speed counter output, both preset values
   A and B must be registered into the value setting table.

| High-speed counter         | Value set      | ting table      |
|----------------------------|----------------|-----------------|
| : (HDM) output<br>: number | Preset value A | √Preset value B |

| HDM25                      | 000 to 999     | 000 to 999      |
| HDM26                      | 000 to 999     | 000 to 999      |
| HDM27                      | 000 to 999     | 000 to 999      |
| HDM28                      | 000 to 999     | 000 to 999      |
| HDM29                      | 000 to 999     | 000 to 999      |
| HDM30                      | 000 to 999     | 000 to 999      |
| HDM31                      | 000 to 999     | 000 to 999      |

 The following condition must be satisfied when setting both preset values in the value setting table.

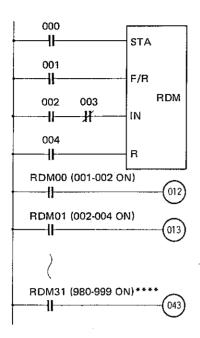

Preset value A  $\leq$  Preset value B For example, if a value set in the value setting table exceeds 999, change the circuit by using an NC contact.

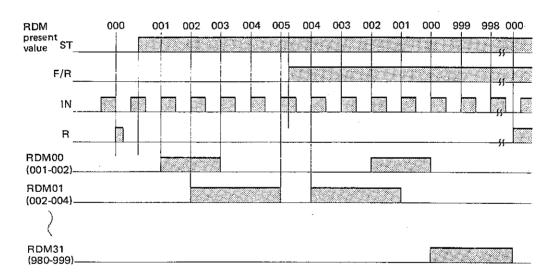

- Preset values in the value setting table can be changed in MONITOR mode only when the RAM is used as a user memory. When the EPROM is used for user programs, preset values in the value setting table cannot be changed.
- The present value of the high-speed counter is retained in the memory during a power failure. If it is required to reset the value upon power application, use the NO contact of special auxiliary relay No. 109 to apply a reset input.
- The counter responds to input signals at up to 1kHz (by hardware processing). However, note that there may be an average delay of 10msec for start, reset, and value setting output signals, as they are processed by software.

#### ■ REVERSIBLE COUNTER (RDM) INSTRUCTION

The RDM instruction can be used as a reversible counter by software.

| Address | OP             | ∗ Data |

| 269     | OUT            | 043    |

#### NOTES:

- \* A reversible counter program must be entered in the order of a start signal (STA), a Forward/Reverse signal (F/R), an input signal (IN), and a reset signal (R).

  \*\* The reversible counter does not require its coil number and cannot be used in duplication.
- \*\*\* The reversible counter does not require its coil number and cannot be used in duplication.

  \*\*\* The reversible counter has 32 outputs (RDM00 to RDM31) for multiple preset value setting. These outputs are programmed similarly to the timer and counter contacts.

  \*\*\* The reversible counter output (RDM31) continues to be in the ON state when the present count value is between 980 to 999 or between 999 to 980. For programming preset values, refer to Section 6.7 Value Setting Operation.

- When the reset input is logical 1, it takes precedence over any other signals and they are ignored. The present value of the reversible counter is reset to "000".
- When the start signal is logical 1, the reversible counter (RDM) is in the operable state. When the start signal is logical 0, the counter is in the halt state.
- When a Forward/Reverse (F/R) signal is logical 0, the reversible counter functions as an up counter. And when the F/R signal is logical 1, it functions as a down counter.
- At the leading edge (i.e., from OFF to ON) of a count input signal, the reversible counter increments or decrements the present value by 1.
- The reversible counter has 32 outputs for multiple preset value setting (RDM00 to RDM31). For these outputs, as many of both NO (一一) and NC (一十) contacts as required can be used.
- For each reversible counter output, both preset values A and B must be registered into the value setting table.

| Reversible counter     | Value set      | ting table and the |
|------------------------|----------------|--------------------|
| (RDM) output<br>number | Preset value A | Preset value B     |

| RDM20                  | 000 to 999     | 000 to 999         |
| RDM21                  | 000 to 999     | 000 to 999         |
| RDM22                  | 000 to 999     | 000 to 999         |
| RDM23                  | 000 to 999     | 000 to 999         |
| RDM24                  | 000 to 999     | 000 to 999         |
| RDM25                  | 000 to 999     | 000 to 999         |
| RDM26                  | 000 to 999     | 000 to 999         |
| RDM27                  | 000 to 999     | 000 to 999         |
| RDM28                  | 000 to 999     | 000 to 999         |
| RDM29                  | 000 to 999     | 000 to 999         |
| RDM30                  | 000 to 999     | 000 to 999         |
| RDM31                  | 000 to 999     | 000 to 999         |

The following condition must be satisfied when setting both preset values in the value setting table.

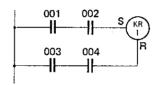

Preset value A ≤ Preset value B For example, if a value in the value setting table exceeds 999, change the circuit by using an NC contact.

- Preset values in the value setting table can be changed in MONITOR mode only when the RAM is used as a user memory. When the EPROM is used for user programs, preset values in the value setting table cannot be changed.
- The present value of the reversible counter is retained in the memory during a power failure. If it is required to reset the value upon power application, use the NO contact of special auxiliary relay No. 109 to apply a reset input.

#### **■ LATCHING RELAY (KR) INSTRUCTION**

The KR instruction can be used as a latching relay in the same manner as a relay circuit.

| Coding  |       |         |  |
|---------|-------|---------|--|
| Address | Se OP | .jData/ |  |
| 200     | LD    | 001     |  |
| 201     | AND   | 002     |  |
| 202     | ĻD    | 003     |  |
| 203     | AND   | 004     |  |
| 204     | KR*   | 1**     |  |
|         | • *   |         |  |

Contents of Registers

| i B R ≥  | : S → :: |
|----------|----------|
| 001<br>— |          |
| 001 002  |          |
| 003      | 001 002  |
| —II—     |          |
| 003 004  | 001 002  |
|          |          |
| 003 004  | 001 002  |
|          |          |

NOTE: \* A latching relay program must be entered in the order of a set input circuit, a reset input circuit and a latching relay coil. Use the KR instruction to program a latching relay coil.

Latching relay number KR0 to KR7.

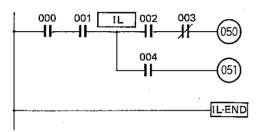

#### Operation of each register

The latching relay operates when the content of the R register is logical 0 and the content of the S register is logical 1. The relay releases when the content of the R register is logical 1.

- When both a set input and a reset input are applied simultaneously, the reset input takes precedence over the set input.
- The content of the latching relay is retained in the memory during a power failure. It continues to be retained until application of a reset input.

## ■ INTERLOCK (IL)/INTERLOCK END (IL·END) INSTRUCTIONS

The IL and IL-END instructions are used in pairs when branching a circuit to plural OUT instructions.

#### Coding

| Address | OP :    | Data |
|---------|---------|------|
| 200     | LD      | 000  |
| 201     | AND     | 001  |
| 202     | 1L      |      |
| 203     | LD      | 002  |
| 204     | AND-NOT | 003  |
| 205     | OUT     | 050  |
| 206     | LD      | 004  |
| 207     | OUT     | 051  |
| 208     | 1L-END  | -    |

NOTE: \* When IL and IL-END instructions are used in programming, be sure that an LD instruction will always follow the IL and IL-END instructions, respectively.

#### Operation of register

The IL instruction causes the content of the R register to be transferred to the interlock flip-flop (ILF). Accordingly, the ILF is set to "0" if the content of the R register is "0" and to "1" if the content of the R register is "1".

The IL-END instruction causes the ILF to be set to "1" irrespective of the content of the R register. In other words, when the IL condition is OFF (i.e., when input 000 or 001 is OFF), the state of each relay between the IL and IL-END instructions is as follows.

| Output relay, internal auxiliary relay | OFF                 |  |
|--|---------------------|--|
| Timer                                  | Reset               |  |
| Counter, latching relay                | Holds present state |  |

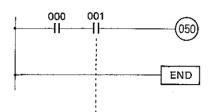

However, when the IL condition is ON, the state of each relay is the same as that in an ordinary relay circuit without IL/IL-END instructions.

CAUTION:

IL and IL-END instructions must always be used in pairs. A pair of IL and IL-END instructions cannot be used by inserting in between another IL/IL-END pair.

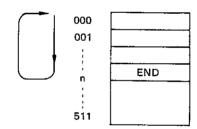

#### **END INSTRUCTION**

Insert this instruction at the end of a program.

| Address | OP  | Data |
|---------|-----|------|
| 000     | LD  | 000  |
| 001     | AND | 001  |
| 002     | OUT | 050  |
| :       | :   | :    |
| 400     | END | _    |

 The program memory of the SYSMAC-S6 is provided with addresses 000 to 511. The CPU scans program data from address 000 to the address with an END instruction according to the sequence diagram.

- When performing a test run, insert an END instruction at each end of a sequence circuit and then delete the END instruction after confirming each circuit. In this manner, the test run can be executed smoothly.
- If the mode selector switch is changed to "MONITOR (or RUN)" to execute a program without inserting an END instruction, neither will the RUN indicator be illuminated nor can the SYSMAC-S6 be operated. In this case, the "END MISS" message will appear on the LCD, and the MEMORY ERR indicator on the CPU front panel will be illuminated.

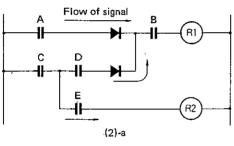

# 5. Programming

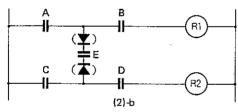

# 5.1 How to Program

With the SYSMAC-S6, a sequence circuit is controlled according to the sequence of the instructions stored in the CPU memory. Therefore, it is necessary to observe the hints on correct programming and programming order.

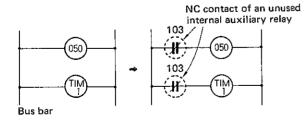

#### **■ HINTS ON CORRECT PROGRAMMING**

- Since the number of contacts is not limited for input/ output relays, internal auxiliary relays, timers, etc., it can be said that the best way to design a sequence circuit is to configure a simple, clear circuit, rather than a complicated circuit created by reducing the number of contacts.
- 2. In the SYSMAC-S6, signals will flow from the left to the right. In other words, signals will flow as if diodes are inserted in the circuit as shown in (2)-a or (2)-b. To operate a circuit without diodes in the same manner as the circuit configured with general control relays, it is necessary to rewrite the circuit.

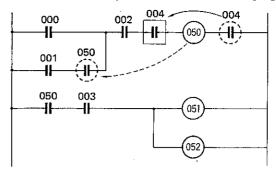

- 3. In a series-parallel circuit, the number of contacts that can be connected in series is not limited, as well as the number of contacts that can be connected in parallel.
- 4. No output relay can be connected directly from the bus bar. If necessary, connect it through the NC contact of an unused internal auxiliary relay.

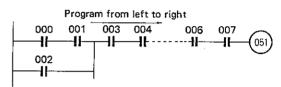

5. All output relays are provided with auxiliary contacts that can be used on a circuit, in addition to the output signal contacts to drive loads actually. The number of contacts that can be used per output relay is not limited.

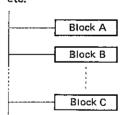

- No relay contact can be inserted next to an output coil.If necessary, insert it before the output coil.
- 7. Two or more output coils can be connected in parallel.
- 8. For contact and coil numbers on the circuit, use the I/O relay numbers described in Section 3.1.
- Output coil numbers (including those for timers, counters and latching relays) cannot be used in duplication.

#### **■ PROGRAMMING ORDER**

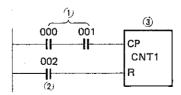

1. Program a circuit from its left to right.

 Assume the circuit elements located from the bus bar to an output relay as one block. If a number of blocks are in line, programming can be started from any block. However, pay attention in the case of circuits utilizing scan time or timing such as differentiator, shift register, etc.

 When composite instructions such as counter, highspeed counter (HDM), reversible counter (RDM), latching relay, etc., are used, their order of programming is predetermined. Be sure to perform the programming according to the predetermined order.

Program in the order of 1 to 3.

# 5.2 Applied Programs

# ■ WHEN LD/OR/AND/NOT INSTRUCTIONS ARE USED

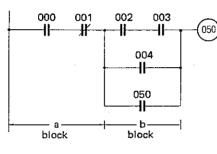

1. An example of parallel-series circuit

| OP      | Data |    |   |
|---------|------|----|---|
| LD      | 000  |    |   |
| AND     | 001  |    | а |
| OR ·    | 050  |    |   |
| AND     | 002  |    |   |
| AND-NOT | 003  |    | b |
| QUT     | 050  | لر |   |
| :       | i i  |    |   |
| END     |      |    |   |

- Process block b after programming block a (parallel circuit).
- For coding, enter I/O relay numbers in the data field.

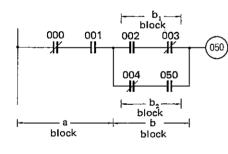

2. An example of series-parallel circuit

| OP      | Data |               |    |
|---------|------|---------------|----|
| LD      | 000  | $\overline{}$ | ]_ |
| AND-NOT | 001  |               | а  |
| LD      | 002  |               |    |
| AND     | 003  |               | b  |
| OR      | 004  |               | ľ  |
| OR      | 050  |               |    |
| AND-LD  | _    |               |    |
| OUT     | 050  |               |    |
| 1       | . :  |               |    |
| END     |      |               |    |

- Divide the circuit into blocks a and b
- and program each block.
  Then combine blocks a and b by AND-LD instruction.

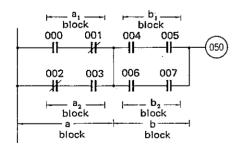

3. An example of series-parallel circuit

| OP S    | Data |                                |

| END    |      |   |

- When a number of blocks continue from block number a to n, the programming procedure is the same as paragraph 4 above. Namely, program the circuit in the following ① block a → ② block b → ③ blocks
- ① block a → ② block b → ③ blocks
  a·b → ④ block c → ⑤ blocks a·b·c
  → ⑥ .....

  Or, program as follows.
  ① block a → ② block b → ③ block c
  → ..... (m) n → (m+1) AND·LD
  → (m+2) AND·LD → (m+3) AND·LD .....
- If this circuit is regarded as either one of the following circuits, it will be easier to understand the program.

| END     |      |

# 11. Examples of circuit requring rewrite

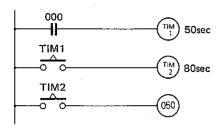

- Such circuits as shown on the upper left cannot be programmed and must therefore be rewritten as shown directly below.
- Since the two upper circuits are respectively configured with control relays, the circuits operate even by the flows of signals shown by the arrows.
   To permit the similar circuit operation with the SYSMAC-S6, the two upper circuits must be rewritten into the corresponding circuits shown below.

#### ■ WHEN TIM/CNT INSTRUCTIONS ARE USED

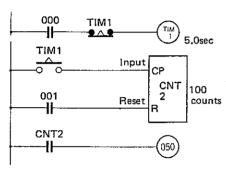

1. Long-time timer

a. Series connection of TIM instructions (e.g., 130sec)

| OF    | 的發展 | Data |
|-------|-----|------|
| LD    |     | 000  |
| TIM   | 1   | 500  |
| LD·TI | M   | 1    |
| TIM   | 2   | 800  |
| LD·TI | M   | 2    |
| QUT   |     | 050  |
| :     |     | :    |
| END   |     |      |

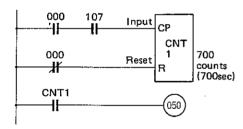

# b. Use of CNT instruction (e.g., 500sec)

| ∵± OP           | Data 1 |
|-----------------|--------|
| LD              | 000    |
| AND-NOT-<br>TIM | 1      |
| TIM 1           | 050    |
| LD-TIM          | 1      |
| LD              | 001    |
| CNT 2           | 100    |
| LD-CNT          | 2      |
| OUT             | 050    |
| :               | 1      |
| END             |        |

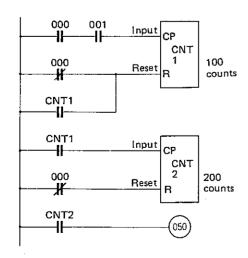

- In this circuit, a pulse is generated every 5 seconds by timer TIM1 and then pulses at intervals of 5 seconds are counted by counter CNT2. The example shown here is a 500sec timer. The setting time of the timer is (timer + scan time) x number of counts.
- The present count value of the counter is retained in memory even if the power switch of the SYSMAC-S6 is turned off.

# c. Use of internal clock pulse (e.g., 700sec)

| OP     | Data |
|--------|------|
| LD     | 000  |
| AND    | 107  |
| LD-NOT | 000  |
| CNT 1  | 700  |
| LD-CNT | 1    |
| OUT    | 050  |
| :      | :    |
| END    |      |

# 2. Multi-digit counter (e.g., 20,000 counts)

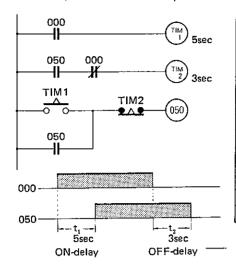

| OP.    | . Data |
|--------|--------|
| LD     | 000    |
| AND    | 001    |
| LD-NOT | 000    |
| OR-CNT | 1      |
| CNT 1  | 100    |
| LD-CNT | 1      |
| LD-NOT | 000    |
| CNT 2  | 200    |
| LD-CNT | 2      |
| OUT    | 050    |
| :      | :      |
| END    |        |

- The SYSMAC-S6 has three types of internal clock pulses (0.1sec clock: 106, 1sec clock: 107, 1min clock: 108).
   By counting any of the types of pulses with a counter, a long-time timer can be developed.
- As CNT instruction is employed, the present count value is retained in memory even after the power is turned off.
- By programming counter circuits in multiple stages, it is possible to develop a multi-digit counter which counts more than 999.

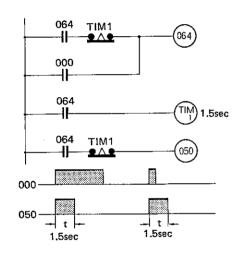

0

# 3. An example of ON/OFF-delay timer circuit

| OP              | Data |
|-----------------|------|
| LÐ              | 000  |
| TIM 1           | 050  |
| LD              | 050  |
| AND NOT         | 000  |
| TIM 2           | 030  |
| LD-TIM .        | 1    |
| OR              | 050  |
| AND-NOT-<br>TIM | 2    |
| OUT             | 050  |
| :               | :    |
| END             |      |
|                 |      |

# 4. An example of one-shot timer circuit

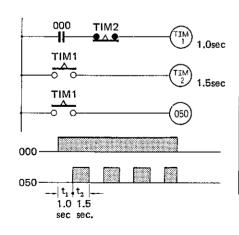

| *a OP           | Data |
|-----------------|------|
| LD              | 064  |
| AND-NOT-<br>TIM | 1    |
| OR              | 000  |
| OUT             | 064  |
| LD              | 064  |
| TIM 1           | 015  |
| LD              | 064  |
| AND-NOT-<br>TIM | 1    |
| OUT             | 050  |
| •               |      |
| END             |      |

 One-shot-output is produced for only the set time of TIM1 after an input signal is applied. (Input 000 > scan time)

# 5. Examples of flicker circuit

# a. With 2 timers used

| OP OP   | Data |
|---------|------|
| LD      | 000  |
| AND NOT | 2    |
| TIM 1   | 010  |
| LD-TIM  | 1    |
| TIM 2   | 015  |
| LD.TIM  | 1    |
| QUT     | 050  |
| :       | :    |
| END     |      |

| . OP | Data |
|------|------|
| LD   | 000  |
| AND  | 107  |
| OUT  | 050  |
| I    | :    |
| END  |      |

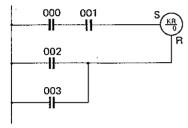

Using an internal clock pulse (0.1sec or 1.0sec), a flicker circuit can be processed easily. In this case, however, the flickering time is available only in the following 2 types.

Special auxiliary relay number 106: 0.1sec clock pulse Special auxiliary relay number 107:

1.0sec clock pulse

#### ■ WHEN LATCHING RELAY IS USED

#### 1. Basic circuit

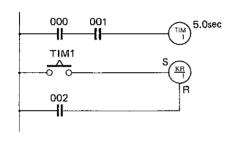

| 000 |
|-----|
|     |
| 001 |
| 002 |
| 003 |
| 0   |
| E   |
|     |
|     |

 In the event of a power failure, the ON/ OFF state before the power failure can be retained in memory, using a latching relay, SYSMAC-S6 has 8 latching relays with relay numbers KR0 to KR7.

 Memory retention time after a power failure is about the same as that of the program memory. (Refer to Section 2.3, Specifications.)

2. A circuit to keep the time-up state

| OP     | " Data |
|--------|--------|
| LD     | 000    |
| AND    | 001    |
| TIM 1  | 050    |
| LD-TIM | 1      |
| LD     | 002    |
| KR     | 1      |
| ŧ      | :      |
| END    |        |

# ■ WHEN IL INSTRUCTIONS ARE USED

| OP OF    | _ Data |
|----------|--------|
| LD       | 000    |
| 1 L.     |        |
| LD       | -001   |
| OR       | 050    |
| AND-NOT  | 002    |
| OUT      | 050    |
| LD       | 003    |
| TIM 1    | 050    |
| LD       | 004    |
| AND      | 050    |
| LD·NOT   | 004    |
| CNT 2    | 025    |
| IL·END   |        |
| <u>:</u> | :      |
| END      |        |
|          |        |

- Program the circuit by taking the common line (a) after the IL instruction, as a bus bar.
- bus bar.
   An IL-END instruction must always be added to the end of a circuit employing an IL instruction. The instructions between the IL and IL-END instructions are executed.
- When input 000 is OFF, timer TIM1 is reset but the present value of counter CNT2 is retained.
- When preparing an automatic/manual circuit, the circuit shown on the left can be operated only in the automatic mode by turning input 000 on automatically.

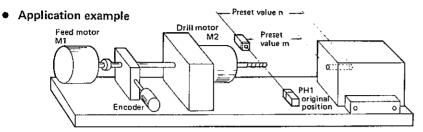

#### WHEN HDM INSTRUCTION IS USED

Application to positioning control.

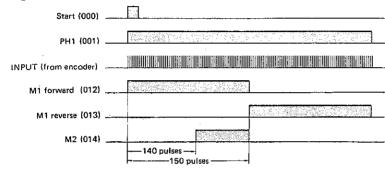

In controlling the depth of each machined hole, depth positioning is performed by counting the number of

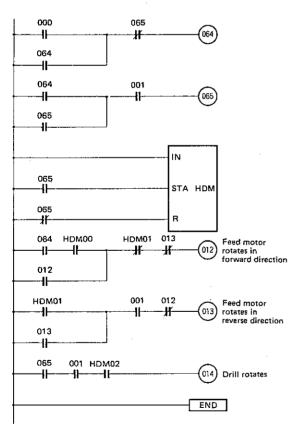

positioning is performed by counting the number of high-speed pulses. Feed motor M1 and drill rotating motor M2 are controlled by the pulses indicating the

drill movement received from the encoder and the original position signal received from photoelectric switch PH1.

## • Timing chart

| НОМ □            | Value setting table |                   |
|------------------|---------------------|-------------------|
| output<br>number | , Préset<br>value A | Preset<br>value B |
| ООМОН            | 000                 | 010*              |
| HDM01            | 150                 | 160*              |
| HDM02            | 140                 | 150               |

NOTE: \* Preset value B is satisfactory if it is equal to or more than preset value A. In this example, preset value B is set with an allowance of 10 pulses by taking the backlash of the feed motor into account.

NOTE: \* Relay 103 is unused internal-auxiliary relay.

2. Application to sequential start/stop control.

When a number of conveyors are to be operated in a conveyor line, sequential start/stop control is often

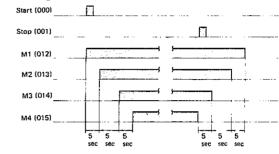

Application example

effected by providing a time lag between the start or stop of one conveyor and that of the next conveyor.

# 6. Operating Procedure

# 6.1 Cautions in Operating SYSMAC-S6

When operating the SYSMAC-S6, pay attention to the following points.

#### CAUTIONS:

- The key inserted into the mode selector switch on the programming console can be pulled out only in the RUN position.
  - Even after the removal of the key, such operations as "search", "monitor", "trace check", etc., can be performed.
- The programming console can be mounted or dismounted to or from the CPU while the SYSMAC-S6 is in "RUN" mode.
  - When the programming console is dismounted
     The CPU remains in the operation mode immediately
     before the programming console is dismounted.
     If the power is turned OFF and then ON with the STOP
     input in the OFF state, the operation mode of the CPU
     will change from the existing mode to "RUN".
  - 2. When the programming console is mounted
    The CPU remains in the operation mode immediately
    before the programming console is mounted. If the
    existing operation mode of the CPU is different from
    the operation mode of the programming console, the
    message "ENTER PASSWORD!" is displayed on the
    LCD of the programming console. In such a case, specify
    the operation mode of the programming console as
    required and depress the and keys, and the
    operation mode of the CPU will change to that specified
    by the programming console. Turning the power OFF
    and then ON will also cause the existing mode of the
    CPU to change to that specified by the programming
    console. If the operation mode of both the CPU and the
    programming console is the same, the CPU remains in
    the mode under execution.

#### 6.2 Basic Functions

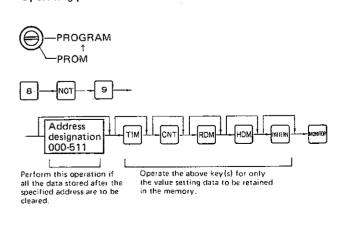

| Item of Operation               | Description  |
|---------------------------------|--|
| All program clear               | Since the CPU retains previously stored data in the RAM memory (by battery or capacitor backup), all the memory contents must be cleared to write a new program into the RAM memory.         |
| Address setting                 | Address setting is required to designate an address in such operations as program read, program write, etc.  |
| Program write                   | This operation is to store a program in the specified memory address.  |
| Program read::                  | This operation is to confirm whether or not data has been programmed properly in the specified memory address.   |
| Value setting:                  | This operation is to write the preset value of the timer, counter, reversible counter (RDM) or high-speed counter (HDM) in the specified value setting table.                                |
| Preset value read               | This operation is to confirm whether or not the preset values have been written properly into the specified value setting table.   |
| Pattern write                   | This operation is to store the ON/OFF states of I/O relays in the specified pattern number.  |
| Pattern read                    | This operation is to confirm whether or not the set and reset conditions in the pattern write operation have been written properly into the specified pattern number.                        |
| Program check                   | This operation is to confirm whether or not the program data written into the memory through the programming console are in agreement with the predetermined rules (syntax).                 |
| Search                          | When a circuit change is to be made in a program simulation or test run, this operation allows an address where an instruction or relay number has been written in a program to be searched. |
| Contact (coil)<br>number change | This operation is to change an instruction or contact (or coil) number in a program due to a circuit modification.   |

| Contact (coil)<br>addition     | This operation is to add an instruction or contact (or coil) number to a program due to a circuit modification.   |
|--------------------------------|---|
| Contact (coil)<br>deletion     | This operation is to delete an instruction or contact (or coil) number from a program due to a circuit modification.  |
| 'Hardware' chēck               | This operation is to check the hardware of the programming console and CPU. In the programming console check, the LCD, keyboard, and mode selector switch are checked for proper operation. In the CPU check, the memory unit, RAM memory, system program, "RUN" indicator, "CPU ERR." indicator, and "MEMORY ERR." indicator are checked for proper operation. |
| RUN-                           | This operation is to place the SYSMAC-S6 in the RUN (Program Execution) mode.   |
| Multi monitor                  | This operation is to monitor and display the operating states of I/O relays, internal auxiliary relays, latching relays and special auxiliary relays, the present and preset values of timers and counters, etc., in units of 4 points, during the execution of a program.  |
| Forced set/reset               | This operation is to set or reset by force the operating state of each of the I/O relays, internal auxiliary relays, special auxiliary relays and latching relays or the present value of each timer or counter during the execution of a program in the MONITOR mode.  |
| Graphic monitor                | This operation is to display the operating states of all the 64 input/output relays (000 – 063) collectively during the execution of a program. In addition, the present values of the reversible counter (RDM) and high-speed counter (HDM) are displayed in both graphics and digits.   |
| Trace<br>(continuity)<br>check | When a circuit operation is to be checked in<br>a program simulation or test run, this opera-<br>tion allows the operating state of each relay<br>number to be displayed while tracing the<br>programming sequence of the circuit.  |
| Pattern monitor                | This operation is to display the pattern numbers registered in output ON/OFF format in the previous Pattern Write operation.  |

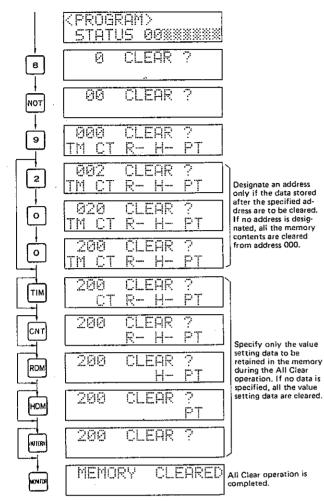

# 6.3 All Program Clear Operation

When the RAM memory is used as a user memory, previously stored programs and/or data are retained in the memory (by battery or capacitor backup) even if a power failure occurs. Therefore, all the RAM memory contents must be cleared to write a new program into the memory. (Although the new program may be written over the previously stored data, this practice is not recommended as it can easily cause program error.)

# Operating procedure

# • Display

#### NOTES:

- All the programs and data stored in addresses from the designated address to address 511, except the value setting data which are not specified as those to be retained in the memory, are cleared by the All Clear operation. If no address designation is made, all the data stored in addresses from 000 to 511 are cleared.
- 2. Before the key operation, change the mode selector switch position from "PROM" to "PROGRAM". At this point, avoid changing the mode selector switch position from "MONITOR" to "PROGRAM". This practice is dangerous, as the CPU is in the RUN state in the MONITOR mode and the load if any connected at that time may operate.
- Upon depression of the MONITOR key, the address displayed on the LCD is extinguished. Subsequent depression of the CLEAR key will cause the LCD to indicate address "000".

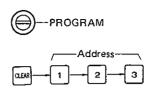

#### CAUTION:

After the PROGRAM mode selection, depression of the CLEAR key or any key other than those keys shown above will not allow All Clear operation to be executed. In this case, repeat the operation starting from the mode selection.

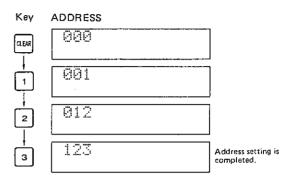

# 6.4 Address Setting Operation

Address setting is required to designate an address in such operations as program read, program write, etc.

#### Operating procedure

#### Display

#### NOTES:

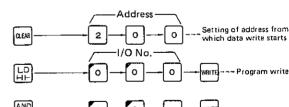

- 1. Each address is set in 3 digits using numeric 000 to 511. To set address "000", no numeric entry is required. To set address "003", depress only numeric key and to set address "023", depress only numeric keys and 3.
- At each depression of a numeric key, the previously displayed number will shift to the left by one digit on the LCD. In address setting, if the first digit of the 3-digit address entered is 6, it is displayed as "O".
- No data will be displayed on the LCD by the address setting operation alone. To display any data, either or key must be depressed first.

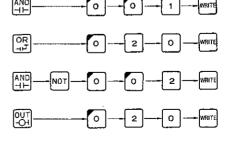

#### 6.5 Program Write Operation

This operation is to store a program in the specified memory address.

#### Operating procedure

PROGRAM

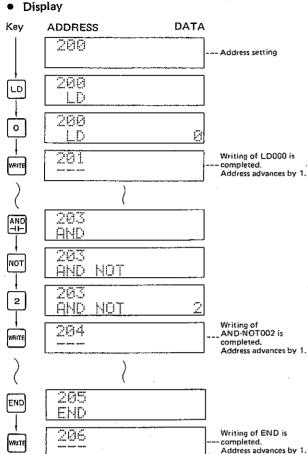

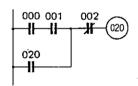

NOTE: The zero key marked on may or may not be depressed.

MRITE

ENC

#### Circuit for exercise and programming example

| Address | OP *    | Data |
|---------|---------|------|
| 200     | LD      | 000  |
| 201     | AND     | 001  |
| 202     | OR      | 020  |
| 203     | AND-NOT | 002  |
| 204     | OUT     | 020  |
| 205     | END     |      |

At each depression of the WRITE key, the data appearing on the OP and DATA sections of the LCD are written into memory.

Correction procedures when an error occurs in program write

- 1. If an error in programming is noticed before depressing the WRITE key, depress the CLEAR DISPLAY key and the reentry operation becomes effective.
- 2. If an error in programming is discovered after depressing the WRITE key, repeat the operation from the address setting, or return to the address in which the error exists by depressing the [\*] key and then depress the CLEAR DISPLAY key and the re-entry operation becomes effective.

# 6.6 Program Read Operation

This operation is to confirm whether or not the data has been programmed properly in the specified memory address.

# Operating procedure

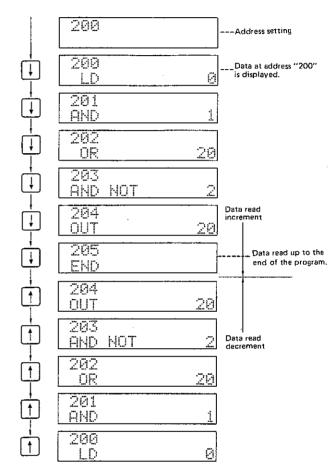

#### CLEAR o 0 ----- Address setting

Data at set address is Data read increment ---displayed.

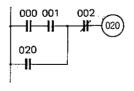

> Data at set address +1 is displayed.

Data at set address -1 Data read decrement is displayed.

#### Display

# · Circuit for exercise and programming example

| Address | OP.     | Data |
|---------|---------|------|
| 200     | LD      | 000  |
| 201     | AND     | 001  |
| 202     | OR      | 020  |
| 203     | AND-NOT | 002  |
| 204     | OUT     | 020  |
| 205     | END     | -    |

- 1. At each depression of the [] key, the data at the set address +1 is displayed (i.e., data read increment).

  2. At each depression of the 1 key, the data at the set address
- -1 is displayed (i.e., data read decrement).

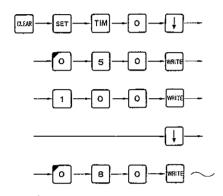

# 6.7 Value Setting Operation

Timer (TIM), counter (CNT), reversible counter (RDM) and high-speed counter (HDM) have their own value setting tables, into which preset time or count values must be registered before executing TIM, CNT, RDM and HDM instructions, respectively. However, with TIM and CNT instructions, this value setting operation may be omitted since the preset values of timers and counters can be entered in a Program Write operation. The preset values written into the respective value setting tables can be changed in the MONITOR mode.

#### Operating procedure

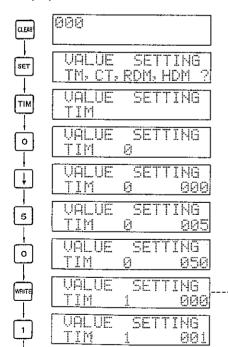

#### Value setting for timer

NOTE: The zero key marked o may or may not be depressed.

# Display

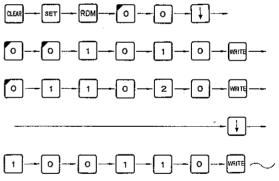

Sec for TIM1 is written into the table, address is incremented by 1 and the data of TIM2 is displayed.

| 0     | VALUE<br>TIM | SETTING<br>1 010 |

| TIM 3       | 8sec         |
| TIM 4       | 3sec         |
| TIM 5       |              |
|             |              |

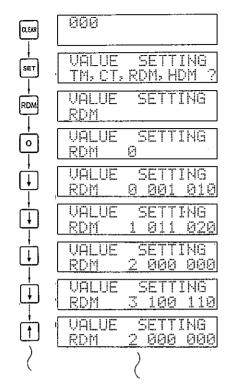

#### Preset value read for reversible counter

NOTE: The zero key marked o may or may not be depressed.

#### Display

Reversible counter value setting

| tabic                |                   |                   |
|----------------------|-------------------|-------------------|
| RDM<br>output<br>No: | Preset<br>value A | Preset<br>value B |
| RDM 00               | 001               | 010               |
| RDM 01               | 011               | 020               |
| RDM 02               | 1                 | +                 |
| RDM 03               | 100               | 110               |
| RDM 04               | 200               | 205               |
| RDM 05               | 500               | 550               |
| RDM 06               |                   |                   |

#### NOTES:

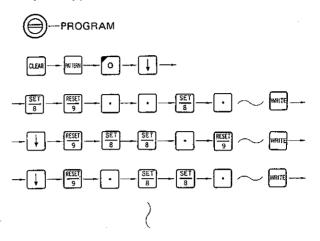

- At each depression of the key, the displayed timer number, counter number, reversible counter output number, or high-speed counter output number is incremented by one, and the preset value(s) of the incremented timer, counter RDM or HDM output number are indicated on the LCD.
- At each depression of the the key, the dispalyed timer number, counter number, reversible counter output number or high-speed counter output number is decremented by one, and the preset value(s) of the decremented timer, counter, RDM orHDM output number are indicated on the LCD.

# 6.9 Pattern Write Operation

The pattern monitoring is a diagnostic function which detects at an early stage whether the controller is operating normally or in the halt state due the occurrence of an abnormality. For this purpose, 10 patterns are provided: Patterns 0 to 9. The operation of the controller is divided into 10 patterns and the ON/OFF states of input/output relays (000 — 063) in each pattern are registered in Patterns 0 to 9, respectively.

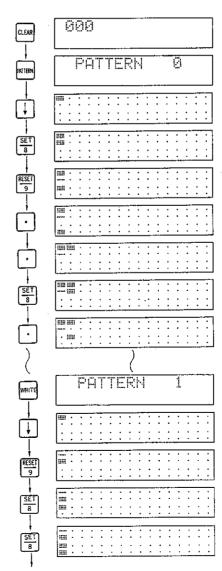

When the controller is in operation, the LCD screen moves in the sequence of the patterns which are coincident with those registered. If the controller stops due to the occurrence of an abnormality, the pattern at that time remains displayed on the LCD. This pattern display thus facilitates maintenance and inspection of the controller.

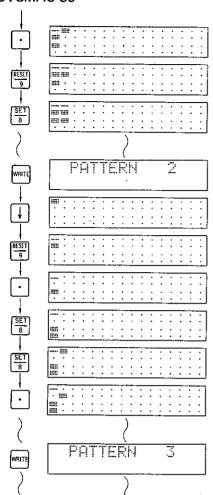

#### Operating procedure

NOTES: The zero key marked a may or may not be depressed.

#### Display

#### Pattern setting table

# 6.11 Program Check Operation

This operation is to confirm whether or not the program data written into the memory through the program console are in agreement with the predetermined rules (syntax).

Program Check Items

\* Syntax error (SYNTAX ER.)

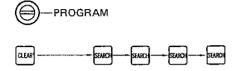

\* Coil duplication error (COIL DOUBLE)

\* Circuit error (CIRCUIT ER.)

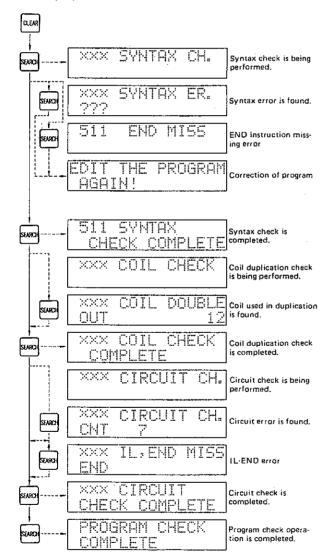

\* IL-END instruction missing error (IL-END MISS)

\* END instruction missing error (END MISS)

## Operating procedure

#### Display

#### NOTES:

- If a program error exists, the address where the error exists and its contents are displayed on the LCD at each depression of the SEARCH key.
- In the display for program check operation shown above, the continuous line between SEARCH keys shows the normal flow of operation when no error exists.
- 3. For details, refer to 9.3, List of Erro Messages and Remedies.

#### Error conditions

#### 1. Syntax error

The message "SYNTAX ER." is displayed on the LCD when an undefined instruction is programmed or when the memory is destroyed.

#### 2. Coil duplication error

The message "COIL DOUBLE" is displayed on the LCD when the OUT, KR, TIM, CNT, RDM or HDM instructions of the same relay number are contained in a program.

#### 3. Circuit error

The R register and S register are controlled by computing a difference between the number of logical start instructions (LD and LD-NOT) and the number of interblock logical instructions (AND-LD and OR-LD). If the difference is abnormal according to the nature of the instructions used when the result (OUT, KR, TIM, CNT, RDM, HDM) is executed, it is regarded as a circuit error, and the message "CIRCUIT ER." is displayed on the LCD.

#### 4. IL/END MISS error

IL and IL-END instructions must be used in pairs. When this rule is not observed in a program as shown below, the message "IL-END MISS" is displayed on the LCD.

- ① IL-END instruction is missing such as IL . . . IL.
- ② 1L instruction is missing and only 1L-END instruction is present.
- 3 The program ends with an IL instruction before the END instruction or the last address.

#### 5. END instruction missing error

In the absence of an END instruction at the end of a program, the message "END MISS" is displayed on the LCD.

#### CAUTIONS

- If a syntax error or an END instruction missing error occurs, no other items can be checked unless the program is edited again and corrected for proper syntax.
- 2. A circuit error is detected by taking that portion of the circuit from the LD-LD-NOT instruction after an OUT instruction to the next OUT instruction as a unit subject to detection.
- 3. Even if any of the following errors occurs, the CPU can still perform the RUN operation. However, be sure to correct the error to execute the proper program.
  - Coil duplication error
  - Circuit error
  - IL/END MISS error

#### 6.12 Search Operation

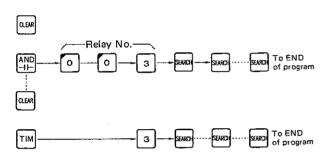

When a circuit change is to be made in a program simulation or test run, this operation allows an address where an instruction or relay number has been written in a program to be searched.

# **■** SEARCH OPERATION OF INSTRUCTION WORD

#### Operating procedure

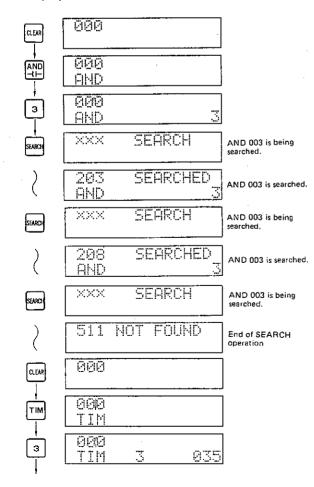

Referring to the circuit for exercise and programming example shown below, an example of searching and  $-(T_{14}^{NM})$  instructions is explained here.

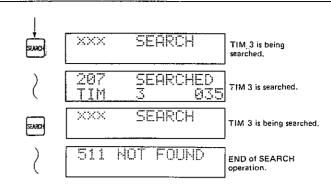

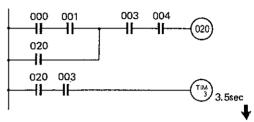

NOTE: The zero key marked [o] may or may not be depressed.

# Display

#### Circuit for exercise and programming example

| Address | · OP | Data_ |
|---------|------|-------|
| 200     | LD   | 000   |
| 201     | AND  | 001   |
| 202     | OR   | 020   |
| 203     | AND  | 003   |
| 204     | AND  | 004   |
|         | 1    |       |

|           | · · · · · · |       |
|-----------|-------------|-------|
| Address : | Ø OP∑Ğ      | -Data |
| 205       | OUT         | 020   |
| 206       | LD          | 020   |
| 207       | TIM 3       | 035   |
| 208       | AND         | 003   |
| 209       | END         | _     |

#### NOTES:

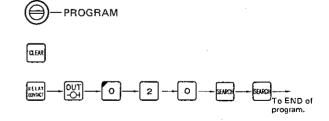

- When the SEARCH key is depressed after entering an instruction, the first address where the instruction is stored is displayed on the LCD. Continued depression of the SEARCH key causes all the addresses containing this instruction to be searched until the last address. In other words, the search operation of an instruction will be executed from the address currently being displayed on the LCD to the last address 511 in the memory.
- If the data being searched is not found, the message "NOT FOUND" appears on the LCD.

# ■ SEARCH OPERATION OF RELAY NUMBER

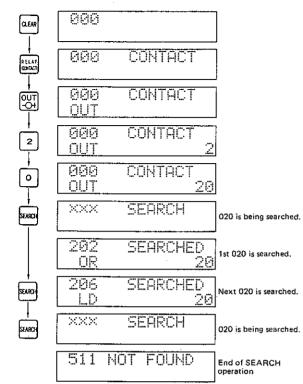

Referring to the circuit for exercise and programming example shown below, an example of searching relay No. 020 throughout all addresses is explained here.

# • Operating procedure

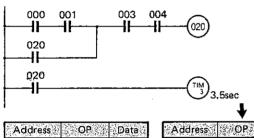

NOTE: The zero key marked o may or may not be depressed.

#### Circuit for exercise and programming example

| Address | . OP | Data |
|---------|------|------|
| 200     | LD.  | 000  |
| 201     | AND  | 001  |
| 202     | OR   | 020  |
| 203     | AND  | 003  |
| 204     | AND  | 004  |
|         | 1    |      |

| Address | Ş OP ∦ | Data |

| 206     | LD     | 020  |
| 207     | TIM 3  | 035  |
| 208     | END    |      |
| •       |        |      |

# NOTES:

- 1. When the SEARCH key is depressed after depressing the RELAY CONTACT and where the instruction is stored is displayed on the LCD. Continued depression of the SEARCH key causes all the addresses containing this instruction to be searched until the last address. In other words, the search operation of a relay number will be executed from the address currently being displayed on the LCD to the last address 511 in the memory.
- If the data being searched is not found, the message "NOT FOUND" appears on the LCD.

511 MOT FOUND

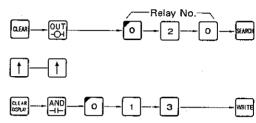

# 6.13 Instruction/Contact (Coil) Number Change Operation

This operation is to change the contact (or coil) number in a program due to a circuit modification.

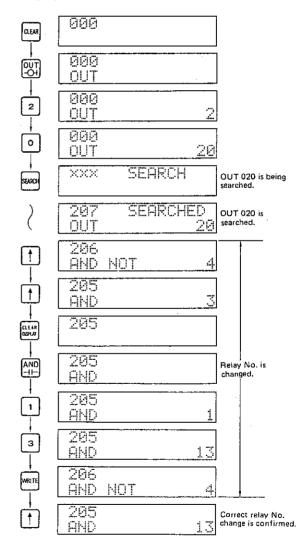

## Operating procedure

Referring to the circuit for exercise and programming example shown on below, an example of changing output relay No. 003 to 013 is explained here.

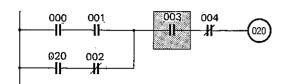

#### Display

Circuit for exercise and programming example

Relay No. 003 ☐ is changed to 013.

| Address | OP ∄        | Data |
|---------|-------------|------|
| 200     | LD          | 000  |
| 201     | AND         | 001  |
| 202     | LD          | 020  |
| 203     | AND.<br>NOT | 002  |
| 204     | OR·LD       | _    |
|         |             |      |

| Address | ≅(OP 🤴      | ; Data |
|---------|-------------|--------|
| 205     | AND         | 003    |
| 206     | AND.<br>NOT | 004    |
| 207     | OUT         | 020    |
| 208     | END         |        |
|         | •           |        |

#### NOTES:

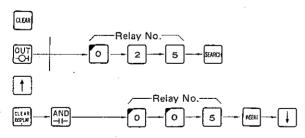

- 1. After an OUT instruction has been searched, depress the key continuously to decrement the address number until the address where the contact (or coil) number is to be changed. The instruction to be changed at an intended address may be searched directly. However, the same instruction may in some cases be stored in other memory addresses of the same program. Therefore, it is necessary to check instructions before and after the intended address. Since no two OUT instructions with an identical relay number exists in one program, the instruction to be changed can be found easily and quickly by first searching the OUT instruction and then searching before and after the OUT instruction.
- When an OUT, TIM, CNT, KR, RDM or HDM instruction is to be changed to another instruction, also check the circuit related to the instruction.
- After the contact (or coil) number has been changed, be sure to perform the Program Check operation ( → → ) to confirm that the program is free from any programming error.

# 6.14 Instruction/Contact (Coil) Addition Operation

This operation is employed when the contact (or coil) number is to be added to a program due to a circuit modification.

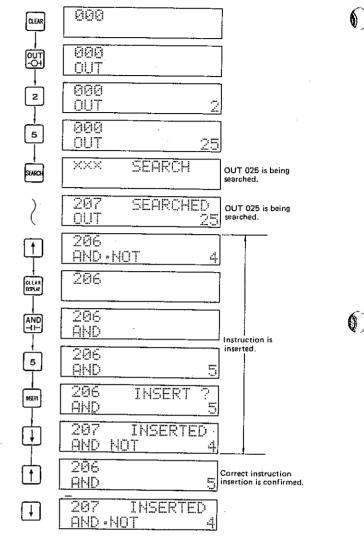

Operating procedure

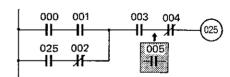

NOTE: The zero key marked [o] may or may not be depressed.

#### Display

- 1. Search an OUT instruction, depress the key repetitively to advance the program up to the address where the instruction is to be inserted. Next, depress the CLEAR DISPLAY key, enter the instruction to be inserted and then depress the INSERT and | keys. The address number after the inserted instruction will automatically be incremented by 1.
- 2. After the contact (or coil) number has been inserted, be sure to perform the Program Check operation ( □ → □ ) to confirm that the program is free from any programming
- 3. If an attempt is made to insert an instruction to a program when the memory is full up to the last address (address 511), the instruction cannot be inserted. This condition is informed by the following message on the LCD.

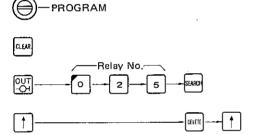

# 6.15 Instruction/Contact (Coil) Deletion Operation

This operation is to delete contact (or coil) number(s) from a program due to a circuit modification.

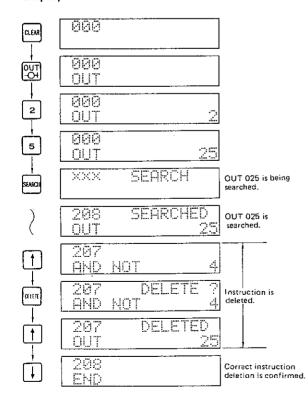

Operating procedure

Referring to the circuit for exercise shown below, an example of deleting \_\_\_\_\_\_ is explained.

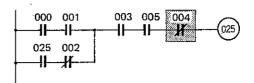

NOTE: The zero key marked o may or may not be depressed.

#### Display

|         |     |       |

#### NOTES:

- 1. Search an OUT instruction, depress the the key to advance the program up to the address where the instruction to be deleted is located, and depress the DELETE and | | keys. All the address numbers after the deleted instruction will automatically be decremented by 1.
- 2. After the instruction has been deleted, confirm instructions before and after the deleted address.
- 3. After the deletion of the instruction, be sure to execute the
- Program Check operation ( [QLM] → [QLM] ).

  4. At each successive depression of the DELETE and the keys, the instruction displayed on the LCD will be deleted. Be careful not to delete the required instruction by operating these two keys unintentionally.

# 6.16 Hardware Check Operation

This operation is to check the hardware of the programming console and CPU. In the programming console hardware check, the LCD section, keyboard and mode selector switch are checked for proper operation. In the CPU hardware check, the ROM memory unit, RAM memory, system program, "RUN" indicator, "CPU ERR" indicator and "MEMORY ERR" indicator are checked for proper operation.

#### PROGRAMMING CONSOLE HARDWARE CHECK

# Operating procedure

#### SYSMAC-S6 Display 1. If the programming console is checked first, the CPU hardware check can be performed continuously subsequent to the <PROGRAM> programming console check. STATUS 00%%%%% 2. Either of the following two numeric keys are to be depressed after the depression of MONITOR key. 0 = Programming console check <PROGRAM> 1 = CPU check 3. During the display check, the data on the LCD-screen moves STATUS 00%%%%% in succession. To make the displayed data static, depress the t key. Depress the l key to return to the previously TEST PROGRAM displayed data. V1,0 4. In the key operation check, be sure to depress the key at the last. Note that if the key is depressed first, the hardware check routine will jump to the mode selector switch CONSOLE PROCON = CPU check. !"#\$%&'()\*+,-,/ 0123456789:;<=>? **■ CPU HARDWARE CHECK** Operating procedure **BABCDEFGHIJKLMNO** PQRSTUVWXYZ[¥]^ - PROGRAM PROM → Program PROM Display (LCD) check \_\_\_\_(|)++ 0 5 Display r<sub>j, •</sub>5770z7taBy (PROGRAM) アイウエオカキワケコサシスセ! **STATUS** 00\*\*\*XX THE KEYBOA Keyboard operation RD PROGRAM STATU5 00%%%%X% PROGRAM TEST 🖸 = PROCON U3.0 1 = CPU MAIN UNIT MAIN UNIT CPU check RUN MAIN ÜNIT Ø Key operation check MEMORY ERR MAIN UNIT Ö Depress the key at the last to check that all the key operations are indicated. If the programming console is checked first, the CPU check can be performed continuously subsequent to the program-MAIN UNIT CPU check ming console check. 2. Either of the following two numeric keys must be depressed after depression of the MONITOR key: 0 = Programming console check

1 = CPU check

For the CPU hardware check, refer to the right column,

# 6.17 RUN Operation

This operation is to place the SYSMAC-S6 in the RUN (Program Execution) mode.

Operating Procedure

Display

#### NOTES:

- When the mode selector switch is set to the "RUN" or "MONITOR" position with the stop signal at the STOP terminal of CPU in the OFF state, the "RUN" indicator illuminates.
- Even if any key on the keyboard is operated during RUN operation, the CPU operation is not affected.

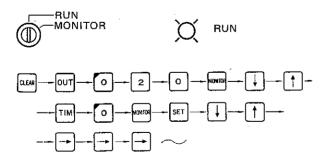

#### **CAUTIONS:**

- In the absence of an END instruction in a program, the CPU operation cannot be performed even if the mode is changed to "RUN" or "MONITOR". The message "END MISS" is displayed on the LCD of the programming console. In such a case, write an END instruction to correct the program in the PROGRAM mode.
- 2. If a CPU error or memory error occurs in "RUN" or "MONITOR" mode, the CPU operation stops, and the "CPU ERR" or "MEMORY ERR" indicator on the front panel of the CPU illuminates. At the same time, the message "CPU ER." or "MEMORY ER." is displayed on the LCD of the programming console and all external outputs are turned off.
- In other than RUN or MONITOR mode, all external outputs are turned off.

#### 6.18 Multi Monitor Operation

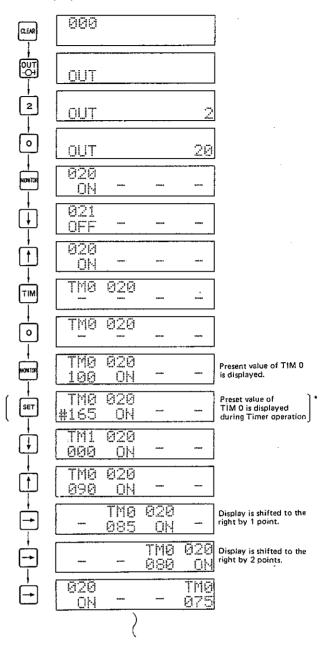

This operation is to monitor and display the operating states of input/output relays, internal auxiliary relays, latching relays, and special auxiliary relays, the status of the reversible counter and the high-speed counter output relays, and the present values and preset values of timers and counters, in units of 4 points during the excution of a program.

#### Operating procedure

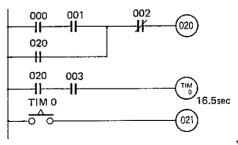

NOTE: The zero key marked o may or may not be depressed.

| END    | _                      |
|        | TIM 0<br>LD·TIM<br>OUT |

#### NOTES

- The operating (ON/OFF) state of each relay, the present value and preset value of each timer or counter, etc., are displayed on the LCD of the programming console.
   Depression of the style key during the monitoring of a timer also causes the preset value of the timer to be dispalyed.
- If the or key is depressed after the depression of the MONITOR key, the displayed relay, timer, or counter number is incremented or decremented by 1, respectively.
- Each depression of the key causes the monitor display point to move rightwards and return to the first point of the 4-point monitor display on the LCD.
- 1, 
   1 and keys are effective only for the leftmost item on the monitor display of each relay, timer or counter.

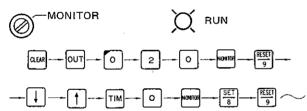

# 6.19 Forced Set/Reset Operation

This operation is to set or reset by force the operating state of each of the input/output relays, internal auxiliary relays, special auxiliary relays and latching relays, or the preset value of each timer or counter during the execution of a program in the MONITOR mode.

In this forced set/reset operation, the operating state of a relay is caused to be set or reset while the  $\frac{SET}{8}$  or  $\frac{RSST}{9}$  key is being depressed, and to return to the original state when the  $\frac{SET}{8}$  or  $\frac{RSST}{9}$  key is released.

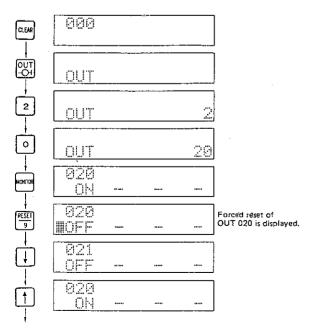

In the forced set/reset operation of a timer or counter, the present value of the timer or counter is up when the key is depressed and the preset value is restored when the key is dpressed.

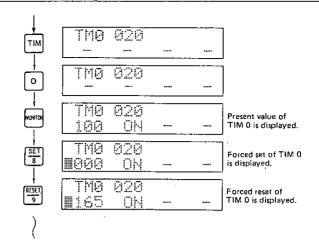

#### Operating procedure

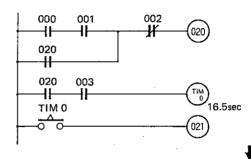

NOTE: The zero key marked [1] may or may not be depressed.

|         |        |       |

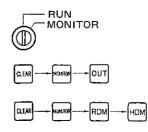

#### NOTES:

- The operating (ON/OFF) state of each relay, the present value and preset value of a timer or counter, etc., are displayed on the <u>LCD</u> of the programming console.
- If the key or key is depressed after depression of the MONITOR key, displayed relay number is incremented or decremented by 1, respectively.
- Each depression of the key causes the monitor display point to move rightwards and return to the first point of the 4-point monitor display on the LCD.
- A forced set or reset is effective only for the leftmost displayed item on the LCD of the programming console.

# 6.20 Graphic Monitor.

This operation is to display the operating states of all the 64 input/output relays (000 - 063) collectively during the execution of a program. In addition, the present values of the reversible counter and high-speed counter are displayed in both graphics and digits.

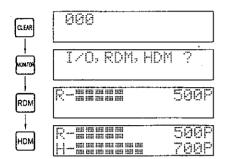

#### Operating procedure

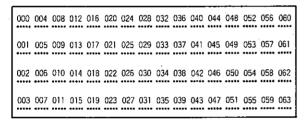

#### Display

#### NOTES:

 The monitor display locations of the 64 I/O relays are as shown below.

2. On the monitor display for each of the 64 I/O relays, graphic symbol " !!!!! " indicates that the relay is in the ON state, while graphic symbol " ..... " indicates that the relay is in the OFF state.

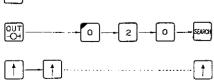

# 6.21 Trace (Continuity) Check Operation

When a circuit operation is to be checked in a program simulation or test run, this operation allows the operating state of each relay number to be displayed while tracing the programming sequence of the circuit. In this operation, a program read can also be performed in the sequence of address.

#### Operating procedure

In the circuit for exercise shown on the right column, the procedure to check the operating state of from 020 to 000 in the programming sequence is shwon below.

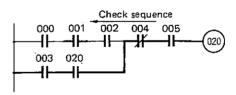

NOTE: The zero key marked o may or may not be depressed

#### Display

# 7. EPROM Chip and Cassette Tape Handling

# 7.1 Basic Functions

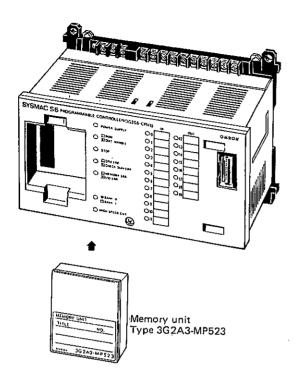

| Item of operation | Description  |
|-------------------|--|
| EPROM write       | This operation is to transfer the contents of the RAM memory in the CPU to the EPROM chip in the memory unit mounted on the PROM writer. |
| EPROM read        | This operation is to transfer the contents of the EPROM chip in the memory unit mounted on the PROM writer to the RAM memory in the CPU. |
| EPROM load        | This operation is to transfer the contents of the EPROM chip in the memory unit mounted on the CPU to the RAM memory in the CPU.         |
| EPROM verify      | This operation is to verify the contents of the EPROM chip in the memory unit against the contents of the RAM memory in the CPU.         |
| Tape write:       | This operation is to record the contents of the RAM memory on a cassette tape.   |
| Tape read         | This operation is to transfer the program data recorded on the cassette tape into the RAM memory.  |
| Tape verify       | This operation is to verify the contents of the RAM memory against the programmed data recorded on a cassette tape.                      |

# 7.2 PROM Writer and MEMORY Unit Handling

# 7.3 Selection of RAM or ROM memory

Either ROM or RAM can be selected as the program memory of the SYSMAC-S6.

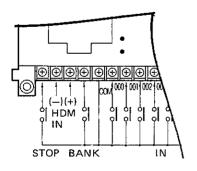

#### RAM mode

- When the memory unit is not inserted in the CPU, the CPU will operate according to the programs in the builtin RAM.
- If the contents of the EPROM chip of the specified bank number are blank with the memory unit inserted in the CPU, the CPU will operate according to the programs in the built-in RAM.

#### ROM mode

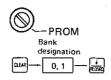

- When the memory unit is inserted in the CPU and any user program is contained in the EPROM chip of the specified bank number, the CPU will operate according to the programs in the EPROM.
- When the BANK input at the BANK terminal of CPU is OFF, bank 0 will be specified and when the input signal is ON, bank 1 will be specified.

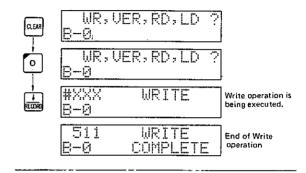

# 7.4 EPROM Write Operation

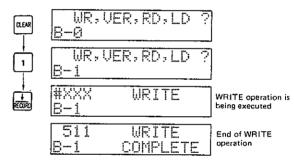

This operation is to transfer the contents of the RAM memory incorporated in the CPU to the EPROM mounted on the PROM writer.

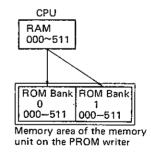

#### · Operating procedure

#### Display

#### NOTES:

 When no memory unit is mounted, the following message appears on the LCD.

NOTE: # indicates bank 0 or 1.

- After all the programs have been written into the EPROM, the bank code of bank 0 or 1 is also written into the EPROM.
- Therefore, the presence or absence of any programs in the specified EPROM bank can be confirmed by checking whether or not the bank code has been written into memory.

# 7.5 EPROM Read Operation

This operation is to transfer the contents of the EPROM chip in the memory unit mounted on the PROM writer to the RAM memory incorporated in the CPU.

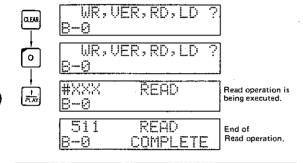

#### Operating procedure

Verify operation is

End of Verify operation

being executed.

#### NOTE:

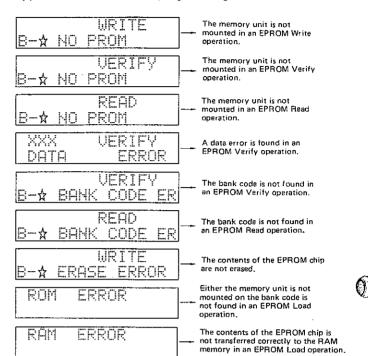

When no memory unit is mounted, the following message appears on the LCD.

NOTE: ☆ indicates bank 0 or 1.

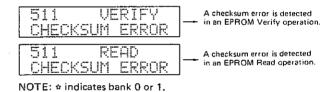

# 7.8 Error Messages in PROM Mode

In the PROM mode, one of the following messages may appear on the LCD of the programming console.

#### NOTE:

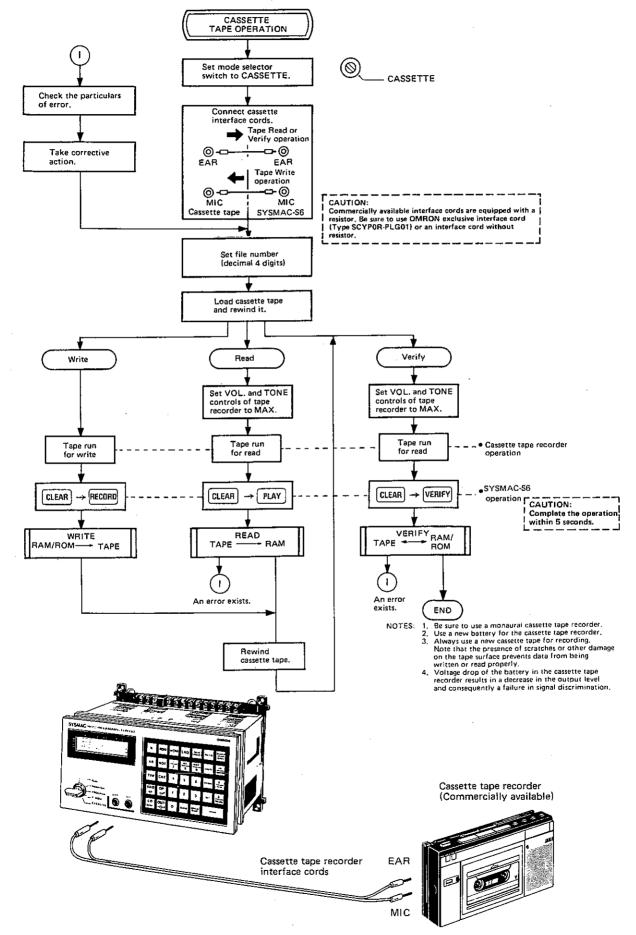

For details, refer to 9.3, List of Error Messages and Remedies.

# 7.9 Cassette Tape Handling

As a method of keeping user programs in storage, data may be recorded on a cassette tape by using a commercially available cassette tape recorder.

### 7.10 Tape Write Operation

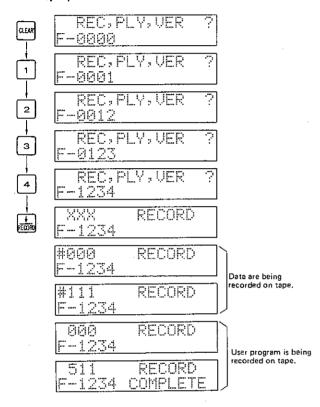

This operation is to record the contents of the user memory (RAM/ROM) on a cassette tape.

#### Operating procedure

### Display

### NOTES:

- Upon completion of the Tape Write operation, be sure to perform the Tape Verify operation to confirm that the data have been recorded properly on the tape.
- Even if the tape does not run, data will be transferred unilaterally from the RAM/ROM. So, be sure to confirm that the tape is running smoothly.
- If the power is turned off or the cassette is ejected during the Tape Write operation, the tape write will be interrupted.
   Retry the tape write operation from the beginning.
- To stop the Tape Write operation under execution, operate the mode selector switch (to other than the "CASSETTE" position).
- For the Tape Write operation, use the MIC jacks on both the programming console and cassette tape recorder to connect one of the two cassette tape interface cords. For subsequent verify operation, use EAR jacks to connect the other interface cord.
- The program number is recorded as the file number on the tape.

### 7.11 Tape Read Operation

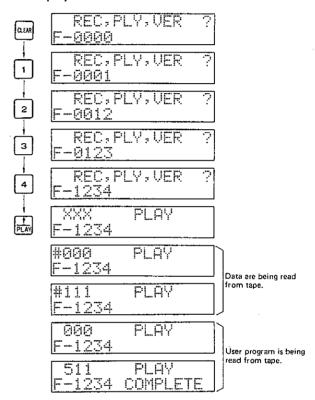

This operation is to transfer the program data recorded on the cassette tape into the user memory (RAM).

#### Operating procedure

### Display

### NOTES:

- Upon completion of the Tape Read operation, be sure to perform the Tape Verify operation to confirm that the data have been transferred properly from the tape to the RAM.
- If the power is turned off or the cassette is ejected during the Tape Read operation, the tape read will be interrupted. Retry the tape read operation from the beginning.
- To stop the Tape Read operation under execution, operate the mode selector switch (to other than the "CASSETTE" position).
- Be sure to set the volume control and tone control of the cassette tape recorder to maximum.
- If the file number does not coincide with the file number recorded in the Tape Write operation, this condition is regarded as an error and no Tape Read operation will be performed.

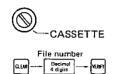

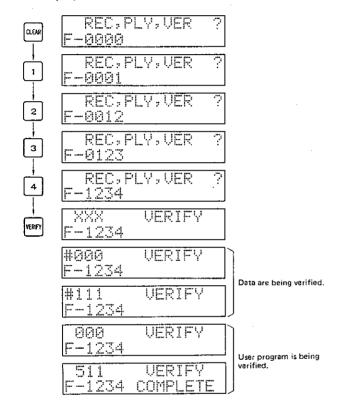

# 7.12 Tape Verify Operation

This operation is to verify the contents of the user memory (RAM) against the programmed data recorded on a cassette tape.

### Operating procedure

### Display

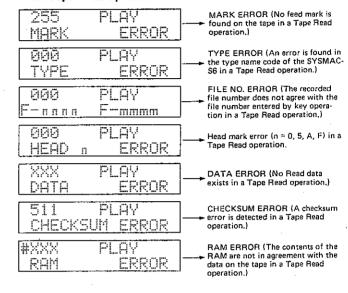

### NOTES:

- If the power is turned off or the cassette tape is ejected during the Tape Verify operation, the tape read will be interrupted. Retry the Tape Verify operation from the beginning.
- To stop the Tape Verify operation under execution, operate the mode selector switch (to other than the "CASSETTE" position).
- Be sure to set the volume control and tone control of the cassette tape recorder to maximum.
- If the number does not coincide with the file number recorded in the Tape Write operation, the condition is regarded as an error and no Tape Verify operation will be performed.

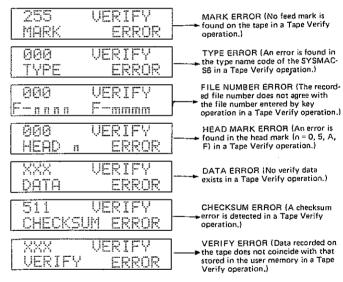

### 7.13 Error Messages in CASSETTE Mode

In the CASSETTE mode, one of the following error messages may appear on the LCD of the programming console.

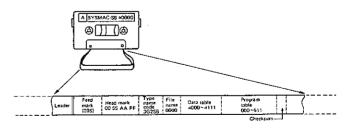

### In Tape Read operation

### • In Tape Verify operation

### • Tape Format

NOTE:

For details, refer to 9.3, List of Error Messages and Remedies,

# 8. Installation and Wiring

The SYSMAC-S6 is a highly reliable programmable controller which is resistant to adverse environmental conditions. However, in order to permit the programmable controller to fully exhibit its functions, as well as to enhance its reliability, care must be exercised on the following points when installing the programmable controller.

# 8.1 Mounting Locations and Environmental Conditions

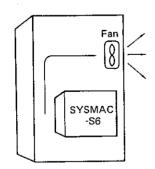

When installing the SYSMAC-S6 programmable controller, avoid the following locations.

- Location where the ambient temperature is beyond the range of 0 to 50°C.
- Location where temperature changes abruptly, thus resulting in condensation.
- Location where relative humidity exceeds the range of 30 to 90%.
- Location subject to corrosive gas or flammable gas.
- Location subject to excessive dust, salt, or iron particles.
- · Location subject to vibration or shock.
- Location subject to direct sunlight.

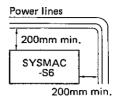

### 8.2 Mounting Positions within Control Panels

When mounting the SYSMAC-S6 in a control panel, take into consideration the operability, maintenability and environmental resistance of the programmable controller.

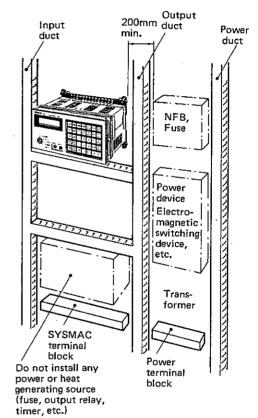

- To permit the use of the SYSMAC-S6 within the ambient operating temperature range, pay attention to the following points.
  - a. Provide the programmable controller with adequate space for ventilation.
  - b. Avoid mounting the controller directly above any heat generating source (heater, transformer, resistor of high capacity).
  - Install a fan for forced ventilation if the ambient temperature exceeds 50°C.

- Avoid mounting the SYSMAC-S6 in a panel in which high-tension equipment is installed.
- 3. Provide a distance of more than 200mm between the high-tension or power lines and the SYSMAC-S6.

4. Mount the SYSMAC-S6 as far away as possible from high-tension equipment or power devices for the sake of safety in maintenance and operation.

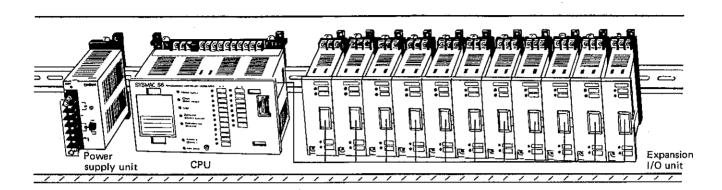

### 8.3 How to Install within Control Panels

### **■ TRACK MOUNTING**

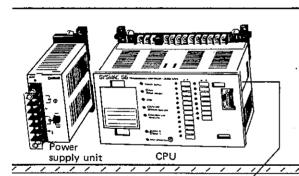

When mounting the SYSMAC-S6 programmable controller within a control panel, all the respective component units of the SYSMAC-S6 can be mounted simply on a DIN rail.

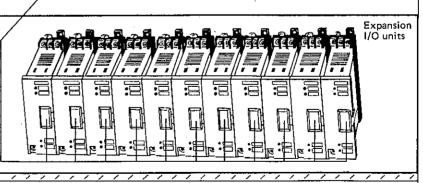

NOTE: Use OMRON Type PFP-100N2 DIN rail.

### **■ SURFACE MOUNTING**

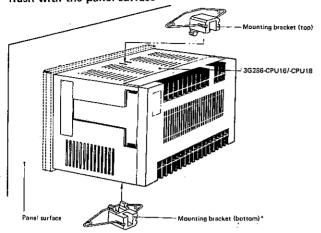

The programmable controller may also be secured to the mounting plate in a control panel. When the expansion I/O units are to be mounted apart from the CPU, use the 1m cable attached.

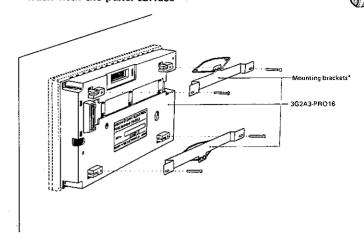

### **■ FLUSH MOUNTING**

 To mount Type 3G2S6-CPU16/-CPU18 flush with the panel surface

NOTE: \*A pair of mounting brackets are supplied as the accessories of the CPU16, and CPU18.

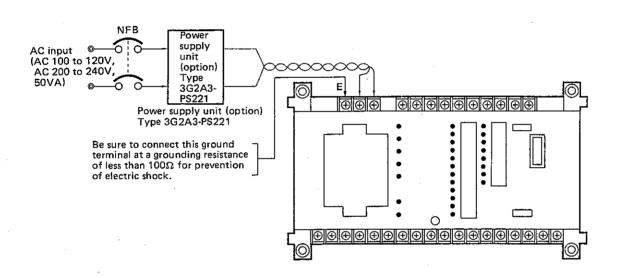

### To mount Type 3G2A3-PRO16 flush with the panel surface

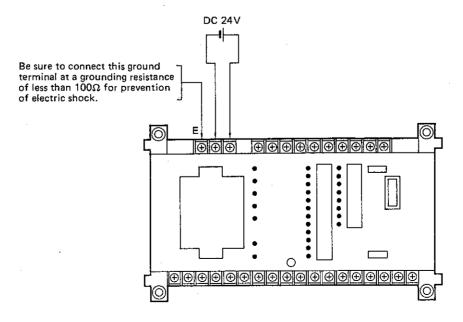

NOTE: \* A pair of mounting brackets are optional.

# 8.4 Wiring and Power Supplies of CPU

### ■ AC POWER SUPPLY

### **DC POWER SUPPLY**

Power supply capacity

The power consumption of the SYSMAC-S6 is less than 10VA. However, upon power application, inrush current of about 5 times the steady-state current will flow through the programmable controller. Take this point into account.

- Power supply wiring
   Use a wire of 2mm<sup>2</sup> min. as the power supply line of the SYSMAC-S6 so as to prevent voltage drop. (Use of twisted pair wires is recommended.)
- For general noise on the power supply line, the noise suppressing circuit in the SYSMAC-S6 is sufficient.
   However, supplying power through a transformer having a transformer voltage ratio of 1:1 will help reduce equip-

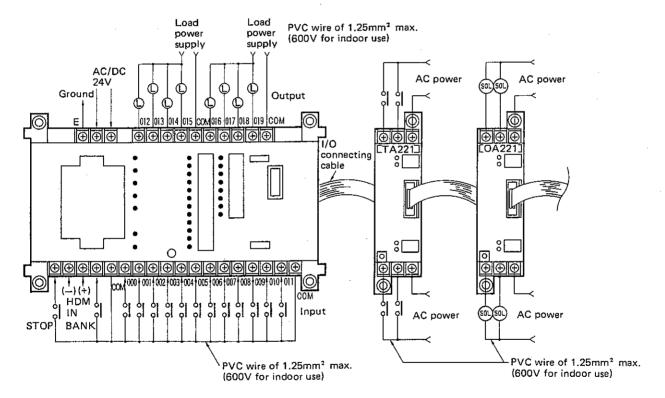

ment-to-ground noise to a great extent and installation of such a transformer is recommended.

Terminal E of the SYSMAC-S6 is a ground terminal used for prevention of electric shock. Use an exclusive ground wire (having a conductor cross-sectional area of  $2 \text{mm}^2$  min.) for grounding at a grounding resistance of less than  $100\Omega$ . Note that common use of the grounding line with other equipment or connecting to the beam of the building may adversely affect the system.

Keep the length of the ground wire within 20m. Care must be taken as to the grounding resistance since it varies depending on the nature of ground, water content, season and the time elapsed after the underground laying of the ground wire.

# 8.5 Connection of CPU and Expansion I/O Units and I/O Wiring

- The CPU and expansion I/O units are interconnected with I/O unit connecting cables.
- Two types of I/O unit connecting cables are available.
   1m cable (Type 3G2A3-CN121)
   13cm cable (attached to each I/O unit)
- A maximum of three 1m I/O unit connecting cables can be used in one system.

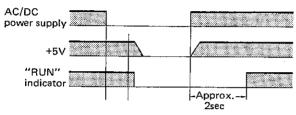

### 8.6 Operation at Power Failure

- 1. As the power supply of the SYSMAC-S6, supply power within +10%, -15% of the supply voltage.
- The power sequence circuit is incorporated in the power supply unit of the SYSMAC-S6 to prevent the programmable controller from malfunctioning due to a momentary power failure or a decrease in the supply voltage.
  - a. Supply voltage drop
     If the supply voltage drops below its 85%, the operation of the SYSMAC-S6 stops, causing external output relays to turn off.
  - b. Momentary power failure

    The CPU continues to operate even if a momentary power failure of less than 10msec occurs.
  - c. Automatic restart
     The CPU will automatically restart after more than 85% of the supply voltage is restored.

### CPU RUN/STOP Timing operation

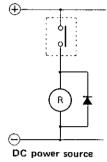

# 8.8 Hints on Use of Output Contacts

If any electrical devices, which are likely to generate electric noise, are to be employed as the output loads of the SYSMAC-S6, be sure to take measures to absorb such noise. For example, electromagnetic relays, valves, etc., generating a noise of 1,200 to 1,300V minimum are subject to noise suppression. For AC operated noise sources, connect a surge suppressor in parallel with the coil of each device. For DC operated noise sources, connect a diode in parallel with the coil of each device.

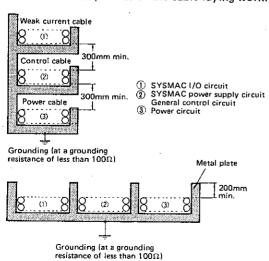

C:  $0.5\mu\text{F} \pm 20\%$  min. Nonpolarity Withstand voltage: 1,500V min. R:  $50\Omega \pm 30\%$ , 0.5W

Select a diode with the breakdown voltage and current ratings according to the load.

# 8.7 External Wiring

- Be sure to process the input/output lines of the SYSMAC-S6 separately from other control lines. (Do not share the conductors of the I/O cable with others.)
- 2. To process the cables for the SYSMAC-S6 with power cables rated at 400V 10A max, or 220V 20A max.:
  - a. Be sure to provide a minimum distance of 300mm between both cables when their racks are paralleled.
  - b. Be sure to screen them with grounded metal plate when both cables are placed in the same duct at the termination process of the cable laying work.

To sustain the proper system operation at all times, it is necessary to inspect the SYSMAC-S6 daily. If any trouble occurs in the SYSMAC-S6, how the system should be protected and how soon it can be recovered from the failure become important. In this chapter, the items to be inspected on the SYSMAC-S6 and the actions to be taken if the SYSMAC-S6 fails are described.

### 9.1 Inspection

To make the most of the functions of the SYSMAC-S6 under the best condition, it is necessary to inspect the SYSMAC-S6 daily or periodically.

### **■ INSPECTION ITEMS**

The SYSMAC-S6 employs semi-conductors as its main component elements. However, the semi-conductors may deteriorate depending on the environmental conditions and must therefore be inspected periodically. The standard inspection cycle is 6 months to 1 year. According to the environmental conditions, it is recommended to advance the date of inspection. As a result of the daily or periodical inspection, if the SYSMAC-S6 is found to be outside the criteria in the following table, be sure to correct the SYSMAC-S6 so that it falls within the prescribed criteria.

| · No. | Inspection item  | Particulars of inspection   | Criteria   |
|-------|--|---|--|
| 1     | AC power supply<br>(a) Voltage<br>(b) Fluctuation  | (1) Is the rated voltage available when measured at the AC input terminal of the Power Supply unit (Type 3G2A3-PS221)?  | AC 85 to 132V or<br>AC 170 to 264V   |
|       |  | (2) Does a momentary<br>power failure occur<br>frequently or is there<br>any sharp rise or drop<br>in the supply voltage?   | The supply voltage must be within the permissible fluctuation range described above.                       |
| 2     | Environmental conditions (a) Ambient temperature (b) Humidity (c) Vibration (d) Dust, etc. | Are the temperature and humidity within the respective range? (When the SYSMAC-S6 is installed in a control panel, the temperature within the panel may be regarded as the ambient temperature of the programmable controller.) | (a) 0 to +50°C<br>(b) 30 to 90% RH<br>(c) Must be free<br>from vibration<br>(d) Must be free<br>from dust. |
| 3     | Power supply of expansion I/O unit (a) Voltage (b) Ripple                                  | Are the voltage and ripple within the operating range when measured at the terminal board of each I/O unit?   | Must conform with<br>the specifications<br>of each I/O unit.   |
| 4     | Mounting conditions  | (1) Are the CPU unit and expansion I/O units secured firmly?  | The mounting screws must not be loose.   |
|       |  | (2) Is each expansion I/O unit fixed firmly?  | Each I/O unit must not be loose.   |
|       |  | (3) Is the I/O connecting cable inserted completely?  | The connecting cable must not be loose.  |
|       |  | (4) Is there any loose screw in the external wiring?  | The screw terminals must not be loose.   |
|       |  | (5) Is there any broken cable in the external wiring?   | The external wiring must be free from any abnormalities in appearance.                                     |
| 5     | Service life   | (1) Output relays in the<br>CPU and expansion<br>I/O units.   | Electrically:<br>100 x 103<br>operations<br>Mechanically:<br>10,000 x 103<br>operations                    |
|       |  | (2) Battery   | 2 years  |

CAUTION:

Be sure to turn off the power before replacing any unit of the SYSMAC-S6.

#### **■ NOTES ON INSPECTION**

- 1. If a defective unit is discovered and replaced, confirm whether or not the replaced unit is abnormal.
- In the event of a faulty contact of the cable, wipe the connector pins with a clean all-cotton cloth moistened with industrial alcohol. Be sure to plug in the flat cable after removing the cloth waste.

# ■ TOOLS AND TESTING EQUIPMENT REQUIRED FOR MAINTENANCE

In the maintenance of the SYSMAC-S6, the following tools and testing equipment will facilitate the daily or periodic inspection of the programmable controller.

- Tools and testing equipment recommended as mandatory equipment
  - Screwdrivers (Phillips and round-blade)
  - Tester or digital voltmeter
  - Industrial alcohol and all-cotton cloth.
- 2. Measuring instruments recommended only if required
  - Synchroscope
  - Pen-recording oscilloscope

### MAINTENANCE PARTS

1. Spare parts

If the SYSMAC-S6 fails, its repair is impossible without any spare parts no matter how early the trouble is discovered. So, it is recommended to have at least one I/O unit as a spare part.

2. Consumables

Fuse for overload protection in each output unit: 4A, AC 200V

- 3. Replacement parts
  - Battery unit (Type 3G2A9-BAT07)
     Service life of battery: 2 years
  - Relay contact output unit Replacement must be made on a unit basis.
     Type 3G2A3-OC221
     Service life of relay:

Electrically:  $100 \times 10^3$  operations Mechanically:  $10,000 \times 10^3$  operations

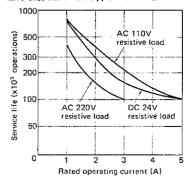

Output relays in the CPU
Replacement must be made on a unit basis.
 Type 3G2S6-CPU15 (Surface mounting type)
 Type 3G2S6-CPU16 (Flush mounting type)

Electrically:  $100 \times 10^3$  operations Mechanically:  $10,000 \times 10^3$  operations

### **■ CHARACTERISTIC DATA**

Service life of relay:

• Life test curve of Type G4C-112P-E output relay

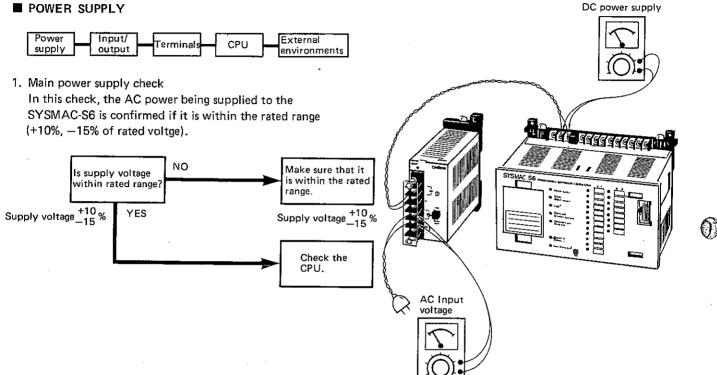

# 9.2 Troubleshooting

If any abnormality occurs in the SYSMAC-S6, thoroughly grasp the condition of trouble, check whether the symptom is reproducible or is caused through relationship with other equipment, and then follow the troubleshooting flowcharts shown below.

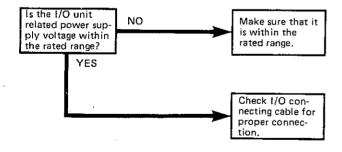

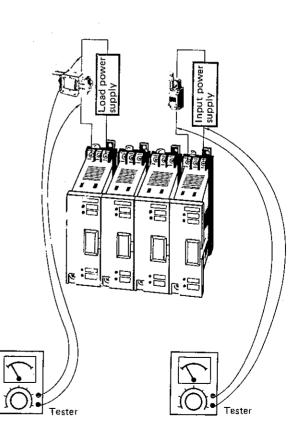

#### ■ POWER SUPPLY

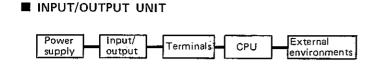

2. I/O unit related power supply check

The power supply for loads is connected to the terminals of each I/O unit. Should any abnormality occur in this power supply, the I/O device connected to the I/O unit will not operate.

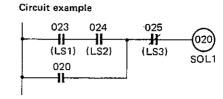

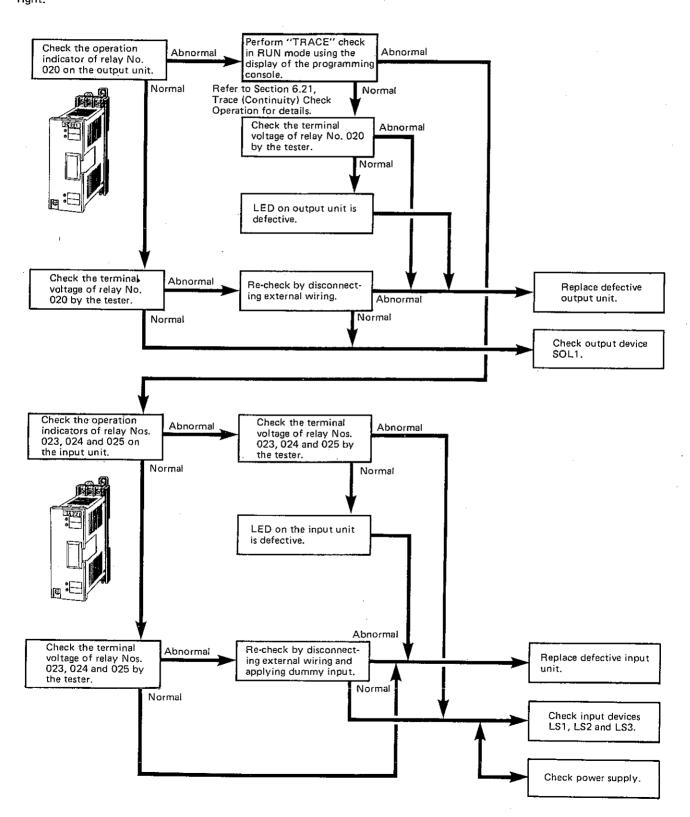

The following flowchart is indicated on the assumption that the maintenance spare parts are provided. If no spare part is provided, first check I/O devices thoroughly. The flowchart is illustrated based upon the circuit example shown at the right.

SOL1 malfunctions!!

# OMRON

### SYSMAC-S6

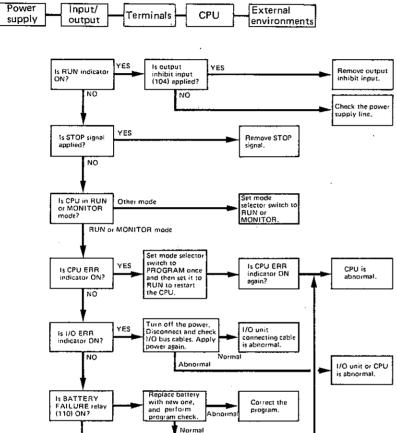

### **TERMINALS**

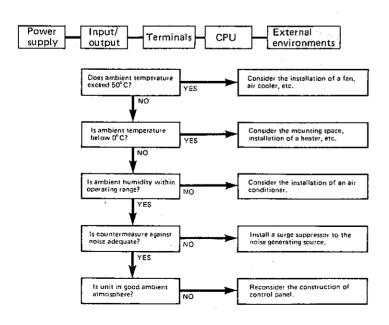

- 1) Check each I/O unit for loose terminals.
- ② Check the power supply terminals for loose connection.
- 3 Check each unit for loose mounting screws.
- 4 Check the I/O connecting cable for proper mounting.

|---------------------------|---------------------------|--|---|
| 255 PLAY<br>MARK ERROR    | No feed mark is<br>found. | An error has occurred in Tape Read operation.     The volume of the tape recorder is too low.  | Perform the Tape Read operation again.     Turn up the volume of the tape recorder.   |
| 000 PLAY<br>TYPE ERROR    | Type error                | 1. An attempt has been made to read a tape other than that for the SYSMAC-S6 (e.g., a tape for SYSMAC-M1R has been read).  2. The type code of the SYSMAC-S6 has not been read normally. | 1. Check the ID label on the cassette tape. 2. Perform the Tape Read operation again. 3. Turn up the volume of the tape recorder. |
| 000 PLAY<br>F-nnnn F-mmmm | File No. error            | Wrong file number has been specified,<br>or the file number has not been<br>specified.   | Specify the correct file number.  |
| 000 PLAY<br>HEAD n ERROR  | Head mark error           | No head mark code (0055AAFF) has been detected.  | Check the ID label on the cassette tape.     Perform Tape Read operation again.     Turn up the volume of the tape recorder.      |
| XXX PLAY<br>DATA ERROR    | Data error                | The data table or program table has not been read.   | Check the ID label on the cassette tape.     Turn up the volume of the tape recorder.   |

# OMRON

# SYSMAC-S6

# • Errors in Tape Read operation (2)

| 511 PLAY<br>CHECKSUM ERROR | Checksum error   | The checksums of the RAM memory and of the tape are not in agreement with one another.           | Perform the Tape Read operation again. |
|----------------------------|------------------|--|--|
| #XXX PLAY<br>RAM ERROR     | RAM verify error | The contents of the RAM are not in agreement with the data on the tape in a Tape Read operation. | Perform the Tape Read operation again. |

### Errors in Tape Verify operation

| Message                      | Definition              | Cause <sup>v.</sup>   | Remedies   |
|------------------------------|-------------------------|---|--|
| 255 VERIFY<br>MARK ERROR     | Feed mark is not found. | <ol> <li>An error occurred in a Tape Write operation.</li> <li>The volume of the tape recorder is too low.</li> </ol> | Perform the Tape Write operation again.     Turn up the volume of the tape recorder and perform the Tape Verify operation. |
| 000 VERIFY<br>TYPE ERROR     | Type error              | An error occurred in a Tape Write operation.  | Perform the Tape Write operation again.  |
| 000 VERIFY<br>F-noon F-mmmm  | File No. error          | Either a wrong or no file number has been specified.  | Specify the correct file number.   |
| 000 VERIFY<br>HEAD m ERROR   | Head mark error         | An error occurred in a Tape Write operation.  | Perform the Tape Write operation again.  |
| XXX VERIFY<br>DATA ERROR     | Data error              | The data table or program table has not been written on the tape in a Tape Write operation.                           | Perform the Tape Write operation again.  |
| 511 VERIFY<br>CHECKSUM ERROR | Checksum error          | The checksums of the memory and of the tape are not in agreement with one another.                                    | Perform the Tape Write operation again.  |
| XXX VERIFY<br>VERIFY ERROR   | Verify error            | The bit in the contents of the memory does not agree with the bit in the contents of the tape.                        | Perform the Tape Write operation again.  |
